Gentlemen:

Administrative Order SWD-1005 dated December 1, 2005 established a limiting surface injection pressure limit of 1420 psi for the captioned well. The well is only capable of taking about 400 BWPD under these conditions which is far short of our current disposal needs.

A step-rate test was run December 5, 2008. The results of this test indicate a bottom-hole parting pressure of 5110 psi. The measured corresponding surface pressure was 1856 psi. The data shows a second zone parting at a bottom-hole pressure of 5310 psi. The measured corresponding surface pressure was 2100 psi.

We believe the Summerville formation was the first to part because it showed a substantially lower frac gradient during the initial frac jobs compared to the other completed zones. (Summerville F.G. = 0.68 psi/ft as compared to 0.96 psi/ft in the Bluff, 0.83 psi/ft in the lower Morrison, and 0.98 psi/ft in the upper Morrison). Therefore, we request that the second (higher) parting pressure be used to calculate the maximum pressure limit. This is justified because injection water would be contained below the Morrison and Bluff formations.

There should not be any affect to offset operators because there are no wells completed in the same zones within a 5 mile radius.

Maralex Disposal, LLC requests that the surface injection pressure limit be increased from 1420 psi to 2100 psi. Attached for your review is the raw data collected during the test and our analysis.

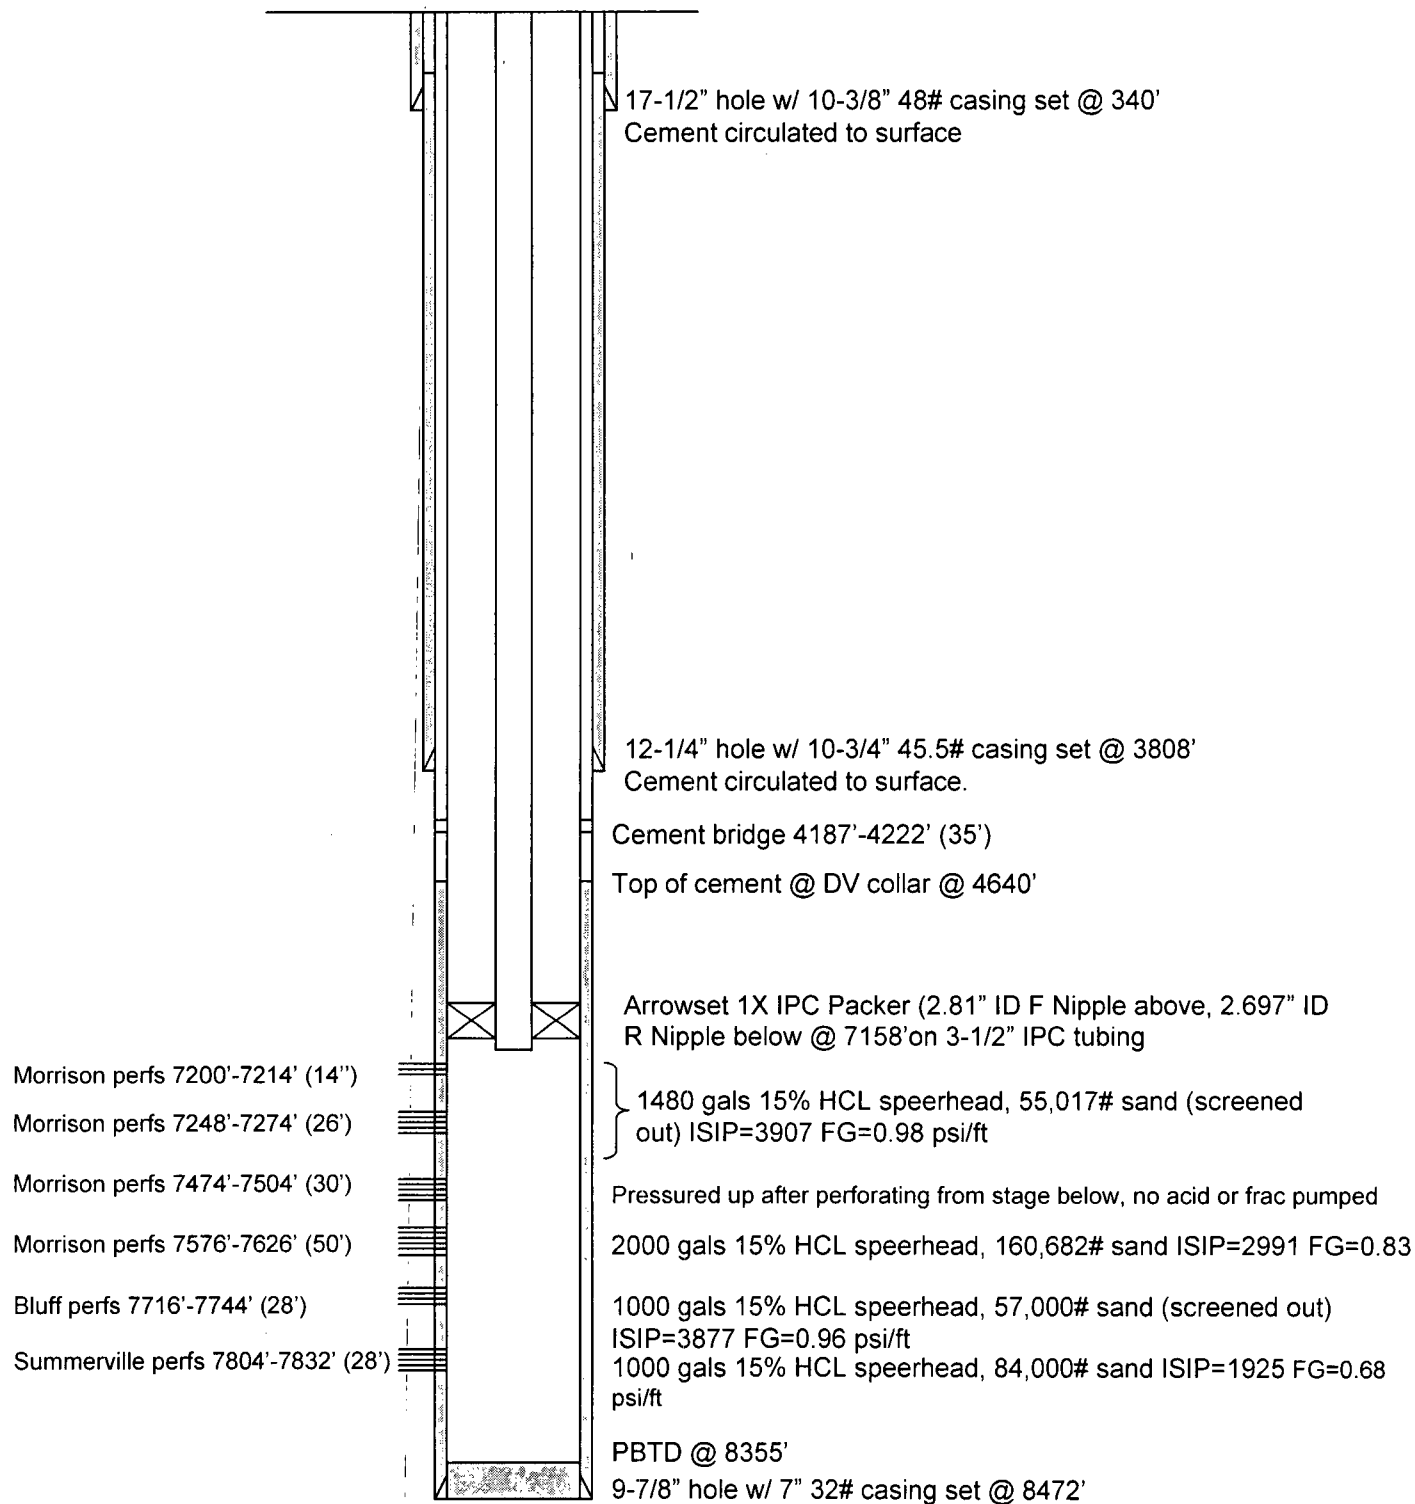

Please feel free to contact me if you need any additional information at (970) 563-4000. Your timely response to this request will be appreciated.

Gentlemen:

Administrative Order SWD-1005 dated December 1, 2005 established a limiting surface injection pressure limit of 1420 psi for the captioned well. The well is only capable of taking about 400 BWPD under these conditions which is far short of our current disposal needs.

A step-rate test was run December 5, 2008. The results of this test indicate a bottom-hole parting pressure of 5110 psi. The measured corresponding surface pressure was 1856 psi. The data shows a second zone parting at a bottom-hole pressure of 5310 psi. The measured corresponding surface pressure was 2100 psi.

We believe the Summerville formation was the first to part because it showed a substantially lower frac gradient during the initial frac jobs compared to the other completed zones. (Summerville F.G. = 0.68 psi/ft as compared to 0.96 psi/ft in the Bluff, 0.83 psi/ft in the lower Morrison, and 0.98 psi/ft in the upper Morrison). Therefore, we request that the second (higher) parting pressure be used to calculate the maximum pressure limit. This is justified because injection water would be contained below the Morrison and Bluff formations.

There should not be any affect to offset operators because there are no wells completed in the same zones within a 5 mile radius.

Maralex Disposal, LLC requests that the surface injection pressure limit be increased from 1420 psi to 2100 psi. Attached for your review is the raw data collected during the test and our analysis.

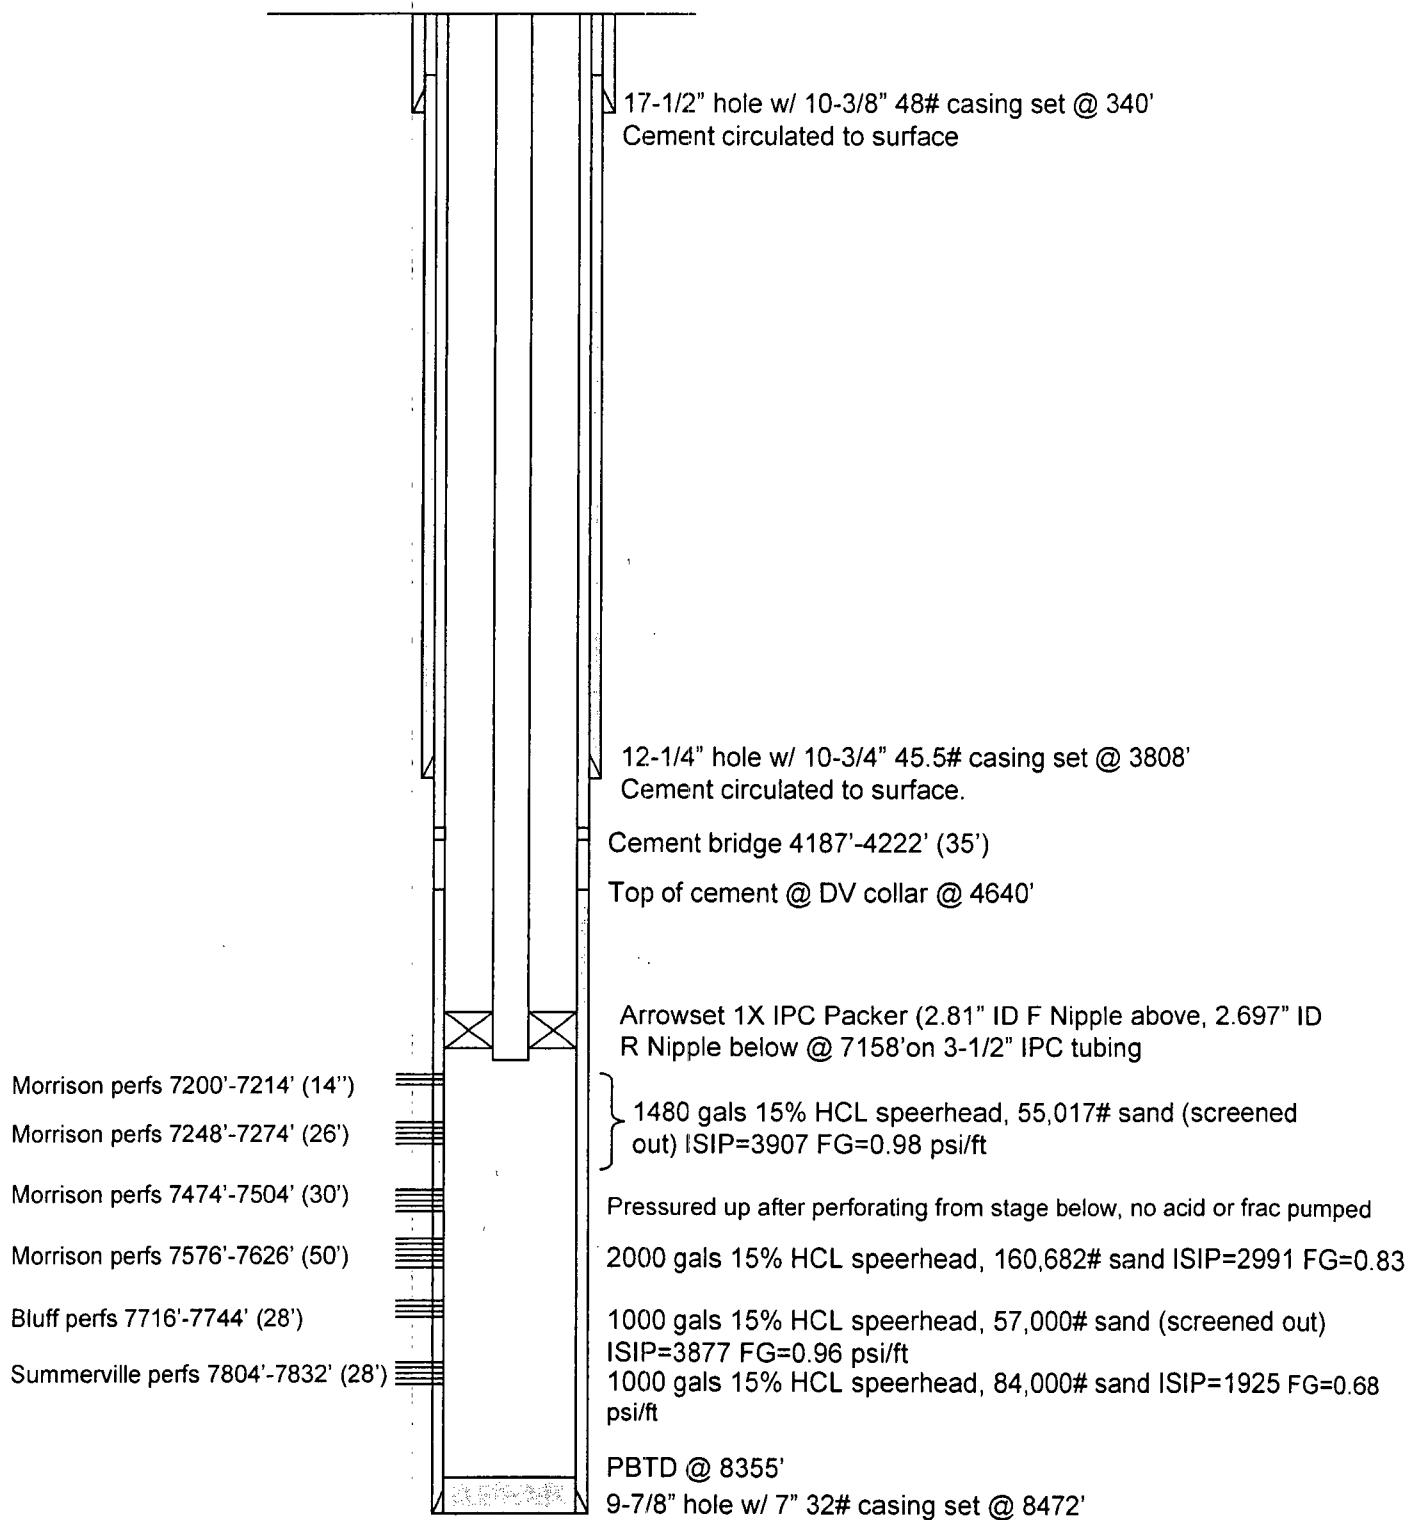

Please feel free to contact me if you need any additional information at (970) 563-4000. Your timely response to this request will be appreciated.
