RE: 2nd 2009 Semi Annual Groundwater Monitoring Results
DCP C-Line Pipeline Release (1RP-401-0)
Lea County, NM (Unit O Section 31, T19S, R37E)

Dear Mr. Lowe:

DCP Midstream, LP (DCP) is pleased to submit for your review, one copy of the 2nd 2009 Semi Annual Groundwater Monitoring Results for the DCP C-Line Pipeline Release Site located in Lea County, New Mexico (Unit O Section 31, T19S, R37E, Latitude 32° 31' 29.7" N Longitude 103° 17' 11.7 W).

If you have any questions regarding the report, please call me at 303-605-1718.

Sincerely

DCP Midstream, LP

Stephen Weathers, PG

Re: Second 2009 Semiannual Groundwater Monitoring Report
DCP C-Line 50602 Release Location in Lea County New Mexico **(1RP-401-0)**
Unit O, Section 31, Township 19 South, Range 37 East

Dear Mr. Weathers:

This report documents the second semiannual 2009 groundwater monitoring activities completed at the C-Line 50602 release location for DCP Midstream, LP (DCP). The monitoring activities were completed on September 23, 2009. The site is located in the southwestern quarter of the southeastern quarter (Unit O) of Section 31, Township 19 South, Range 37 East (Figure 1). The approximate coordinates are 32.52500 degrees north, 103.28667 degrees west.

The groundwater-monitoring network includes the nine wells shown on Figure 2. Table 1 summarizes construction information for each well.

SUMMARY OF MONITORING ACTIVITIES

The depth to water and free phase hydrocarbons (FPH), if present, were measured in each well prior to purging and sampling. None of the wells contained FPH. FPH has not been measured in MW-1 since June 2005 and in MW-2 since March 2007.

Eight of the nine wells were purged and sampled. Well MW-6 was not sampled because it is located down gradient from unaffected boundary wells MW-7, MW-8 and MW-9 so it does not provide chemical information that is relevant to this study.

The wells were purged using dedicated bailers until a minimum of three casing volumes of groundwater were removed and the field parameters temperature, pH and conductivity stabilized or until the water in the well bailed down. The well purging forms are attached. The affected purge water was disposal of at the DCP Linam Ranch facility.

Unfiltered samples were collected following well stabilization using the dedicated bailers. All of the samples were placed in an ice-filled chest immediately upon collection and delivered to the analytical laboratory (AccuTest Laboratory) using standard chain-of-custody protocol. The samples were analyzed for benzene, toluene, ethylbenzene and total xylenes (BTEX). The anlytical laboratory report is attached.

A field duplicate was collected from MW-2. A sample was collected from MW-8 for matrix spike, matrix spike duplicate analysis. The quality control QC evaluations completed for this event include:

- All of the samples were analyzed within the required holding times;
- The BTEX constituents in the trip blank were all below their method detection limits;
- All of the individual surrogate spikes were within their control limits;
- The method blank and blank spike evaluations were all acceptable;
- The primary and duplicate samples from MW-2 were both below all of the method reporting limits; and
- The matrix spike and matrix spike duplicate results were all within their respective control ranges and exhibited good agreement.

The information above indicates that the data is suitable for evaluating groundwater monitoring data.

RESULTS AND INTERPRETATIONS

The fluid measurements are summarized in Table 2. The calculated groundwater elevations for all monitoring episodes are summarized in Table 3. Figure 3 includes hydrographs for all site wells. The water table elevations decreased in all of the wells.

Figure 4 shows the calculated groundwater contours as generated using the Surfer® program with the kriging option. The water table exhibits a consistent gradient toward the southeast. This pattern reflects the historic trends.

The 2009 BTEX results are summarized in Table 4. The constituents that exceed the New Mexico Water Quality Control Commission (WQCC) Groundwater Standard are highlighted as bold text. The benzene standard was exceeded in MW-1 and MW-3. The standards for toluene and xylenes were exceeded in MW-3.

Figure 5 depicts the spatial benzene distribution. Benzene was reported at 0.66 mg/l in MW-1, 5.68 mg/l in MW-3 and 0.0022 mg/l in MW-4. The remaining wells, particularly down-gradient boundary wells MW-7, MW-8 and MW-9, did not contain benzene above the 0.002 mg/l method reporting limit.

The data for all sampling events are compiled in Table 5 for benzene, Table 6 for toluene, Table 7 for ethylbenzene and Table 8 for xylenes. The changes in benzene concentrations over time are plotted for wells MW-1 and MW-3 on Figure 6. Sampling in MW-1 began in December 2005 after removal of the FPH was completed. The benzene concentration in MW-1 decreased slightly between March 2009 and September 2009. The current value remains within the lower part of the historical fluctuation range. Sampling in MW-3 began in November 2002 at the start of the project. The benzene concentration increased from the March 2009 concentration but it also remains in the lower part of the measured concentration range..

The benzene concentration in MW-4 of 0.0022 mg/l was below the WQCC Groundwater Standards. MW-4 lies directly down-gradient from the original release area surrounding MW-1 that was remediated immediately following the spill. The data for MW-4 in Table 5 establishes that natural bioremediation processes are attenuating the BTEX constituents between MW-1 and MW-4.

Benzene has not been detected at or above the 0.002 mg/l method reporting concentration in either MW-2 or MW-5 since June 2005. The elevated concentrations in MW-3, a well that lies west of the centerline for the groundwater plume from the pipeline release area, remains anomalous. Wells MW-7 and MW-8 are both located downgradient from this well, and BTEX constituents have not been detected in these wells effectively bounding the down-gradient migration of the dissolved-phase constituents.

The wells are gauged monthly for FPH. The vacuum extraction system will be operated as necessary to ensure that no FPH is present in the wells.

The next monitoring event is scheduled for the first half of 2010. AEC will provide appropriate notification prior to the onset of sampling activities.

Do not hesitate to contact me with any questions or comments on this report.

Notes:

All units in feet.

Blank cells: wells not installed

The groundwater elevation values for MW-1 and MW-4 were corrected when free phase hydrocarbons were present using the following formula (all values in feet):

GWE_{corr} = MGWE + (PT*PD): where

- MGWE is the actual measured groundwater elevation;
- PT is the measured free-phase hydrocarbon thickness, and
- PD is the free phase hydrocarbon density (assumed 0.7).

Table 4 – Second Semiannual 2009 Results

Well	Benzene	Toluene	Ethylbenzene	Total Xylenes
