RE: 1st Quarter 2010 Groundwater Monitoring Results
DCP Eldridge Ranch Study Area (AP#-33)
Unit P, Section 21, Township 19 South, Range 37 East
Lea County, New Mexico

Dear Mr. Lowe:

DCP Midstream, LP (DCP) is pleased to submit for your review, a one copy of the 1st Quarter 2010 Results for the DCP Eldridge Study Area located near Monument, New Mexico (Unit P, Section 21, Township 19 South, Range 37 East).

If you have any questions regarding the report, please call at 303-605-1718 or e-mail me swweathers@dcpmidstream.com .

Sincerely

DCP Midstream, LP

Stephen Weathers, P.G.

Subject: First Quarter 2010 Groundwater Monitoring Report
DCP Midstream, LP Eldridge Ranch Study Area, Lea County, New Mexico
Unit P, Section 21, Township 19 South, Range 37 East **(AP-33)**

Dear Steve:

This letter summarizes the activities completed and data generated and provides conclusions and recommendations for the first quarter 2010 groundwater-sampling event at the DCP Midstream, LP (DCP) Eldridge Ranch Study Area. The study area is located approximately 1 mile north and 0.75 miles east of the town of Monument in Lea County New Mexico (Figure 1). The New Mexico Oil Conservation Division (OCD) location descriptor is Unit P, Section 21, Township 19 South, Range 37 East. The coordinates for the location are 32.642 degrees north, 103.256 degrees east.

DCP purchased the Huston property on or about June 1, 2010 after the groundwater sampling was completed but before this report was prepared. The boundaries are shown on Figure 2. DCP now owns both the former Huston property and the former Eldridge property (Figure 2). The northern approximate fifth of the study area is owned by the State of New Mexico, and it is currently leased by DCP.

FIELD PROGRAM DESCRIPTION

The groundwater monitoring activities were completed on March 23, 2010. All activities followed the protocols included in the Sampling and Analysis Plan (SAP) that was prepared for this project and approved by the OCD. The well locations are shown on Figure 2. Table 1 provides construction information for the wells.

The groundwater monitoring activities are divided into water table measurement, free phase hydrocarbon thickness measurements and groundwater sampling. The activities completed and the data generated are summarized below.

Water Table Measurement

The fluid levels were measured prior to purging each well. Wells that contained FPH were not sampled. The fluid measurement data are summarized in Table 2. All of the historical corrected water table elevation data are included in Attachment A.

Approximate corrected water-table elevations for the wells containing FPH were estimated using the following formula:

GWE_{corr} = MGWE + (FPHT*PD): where

- MGWE is the actual measured groundwater elevation;
- FPHT is the measured free-phase hydrocarbon thickness; and
- PD is the FPH density (assumed at 0.72 based upon site data).

Hydrographs for select wells are included in Figure 3. The hydrographs indicate that the water table remained relatively unchanged across the site.

Water table contours based upon the corrected data are shown in Figure 4. The contours were generated using the Surfer® program and modified based upon site-specific considerations. This figure is discussed below in the conclusions section. The 3.61-foot head difference between MW-1 and MW-1D (Table 2) falls slightly outside the historic range of 3.52 to 3.59 feet.

Free Phase Hydrocarbon Thickness Measurements

The FPH thickness measurements are summarized in Table 3. Wells MW-26, MW-27 and MW-CC contained FPH. The current thicknesses all remained at or below 0.67 feet (8 inches).

FPH thickness over time is plotted on Figure 5 for the above three wells. The thickness declined appreciably in all three wells from the fourth quarter 2009 measurements. The long-term FPH thickness trends are discussed in the conclusions below.

Groundwater Sampling and QA/QC Analysis

Representative groundwater samples were collected from 49 wells. The remaining wells either contained FPH, where blocked by roots (MW-22) or are only used for groundwater level measurement.

Every well except the house well and the irrigation well was purged using a dedicated bailer. Purging continued until a minimum of three casing volumes of water was removed and the field parameters temperature, pH and conductivity stabilized. The house well and irrigation well were purged using a submersible pump. The affected purge water was disposed of at the DCP Linam Ranch facility.

All wells were sampled using a dedicated bailer. The samples were placed in an ice-filled chests immediately upon collection and shipped to the Accutest Laboratory in Houston Texas using standard chain-of-custody protocols. The unfiltered samples were analyzed for benzene, toluene, ethylbenzene and total xylenes (BTEX) using EPA Method 8260B.

The BTEX results for the monitoring episode are summarized in Table 4. The historic BTEX data are summarized in Attachment B. The laboratory report is included in Attachment C. Constituents that exceed the New Mexico Water Quality Control Commission (NMWQCC) groundwater standards are highlighted as bold text.

The QC evaluations included:

- There were no constituents detected in the trip blank;
- All analyses were completed within the required holding times;
- All of the applicable individual surrogates were within their ranges;
- The method blanks results were all nondetect;
- The blank spikes were all within their acceptable ranges;
- The matrix spike/matrix spike duplicates for four site samples were all within their control ranges with the exception of MW-11 that had a concentration that was biased high for benzene and ethylbenzene and low for xylenes. There were 15 samples from the Eldridge site in this lot. None of the BTEX constituents were detected in 10 of the 15 samples. Four of the remaining wells (MW-11, MW-12, MW-23 and MW-M) are in source areas, and they contain benzene above the method detection limit. The remaining sample, MW-4, lies well north of the downgradient boundary so an xylene exceedance in this well would not indicate an off-site release.
- The relative percentage difference values for the duplicates with detected constituents were acceptable.

The quality control evaluations verify that the data are suitable for their intended use of routine groundwater monitoring evaluation.

The benzene concentrations and the calculated isopleths are shown on Figure 6. The isopleths were generated using the Surfer® program with a kriging option and then modified to accurately define the site-specific conditions. The distributions are discussed below.

CONCLUSIONS

The interpretations and conclusions are grouped according to groundwater flow, FPH thickness, spatial benzene distribution and temporal benzene distribution.

Groundwater Flow

The groundwater flow pattern for this monitoring event reflects conditions that have generally been present over most of the site history, including:

1. The water table gradient increases south of the boundary between the DCP-Huston and the DCP-Eldridge Properties (Figure 4). An area with a flatter gradient is present in the center of the DCP-Huston property between groundwater contours 3606 and 3608 feet.

2. The groundwater flow north of MW-22 is generally southward. The groundwater flow then deflects toward the southeast in the southern half of the study area (Figure 4). This pattern reflects the alignment of the surface drainage.

3. The groundwater low associated with MW-15 and, to a lesser extent, MW-14 has stabilized after a year of transition. The area is localized, and does not affect the regional groundwater flow pattern.

4. The low at MW-A is an historical anomaly that has been present from the start of the project.

The above trends have been present for the past several sampling episodes. This consistency indicates that the groundwater conditions are generally equilibrated across the site.

Free Phase Hydrocarbon Thickness

Conclusions related to FPH for this monitoring event include:

1. The FPH thickness in wells MW-27 and MW-CC has been gradually declining since April 2008. These wells are adjacent to each other on the western edge of the study area in the middle of the DCP Huston property (Figure 2).

2. The FPH thickness in both MW-27 and MW-CC have declined to where they are either approaching (MW-27) or below (MW-CC) 0.5 feet.

3. The thickness in MW-26 decreased from the previous event after increasing for several events.

4. The FPH thickness in MW-26 has remained below 0.5 feet over the duration of the project, and it had fallen to below 0.25 feet at this event.

5. Less than 0.1 gallon of FPH is removed weekly from each of the above three wells due to the thinness and relative immobility of the FPH. More aggressive removal is not warranted given these nominal volumes.

Spatial Benzene Distribution

Conclusions on the spatial benzene distribution that are derived from the Figure 6 isopleth map include:

1. The plume labeled North Area on Figure 6 is physically separated from the other plumes. The part of the plume that exceeds the NMWQCC groundwater standards may now be limited to the State land.

2. A plume in the central area that appears to originate from the area of MW-26 is naturally attenuating along an alignment that includes MW26 (FPH), MW-EE (1.2 mg/l), MW-23 (0.107 mg/l) and MW-MM (0.0113 mg/l).

3. Another separate plume in the central area that includes MW-27, MW-LL, MW-CC, MW-N, MW-O, MW-Q, MW-M, MW-12 and MW-11 probably resulted from multiple non-DCP releases. This plume is elongated toward the southeast, and it attenuates to below the NMWQCC groundwater standard in the middle of the Huston property down gradient from MW-8.

4. There were no exceedances of the NMWQCC groundwater standard south of MW-8. This area includes the approximate southern one-third of the DCP-Huston property and all of the DCP-Eldridge property.

5. There is no evidence of dissolved phase hydrocarbon plume expansion. In fact, the down-gradient boundaries of the dissolved-phase benzene appear to be contracting as discussed below.

Temporal Benzene Distribution

The site is broken into three areas as shown on Figure 2 to facilitate discussion of the temporal benzene distributions. The evaluation begins with the north (former NMG) area and then moves to the central area. The south area, discussed last, includes the southern part of the DCP-Huston property and the DCP-Eldridge property.

Benzene-time graphs for select wells in the three areas were updated and evaluated for indications of dissolved phase hydrocarbon plume expansion. The historic benzene data used to generate these plots are summarized in Attachment B.

North Area

Time-benzene plots for the north area are shown on Figure 7. Down-gradient monitoring wells NMG MW-11 and NMG MW-13 are not included because no BTEX constituents have ever been detected in them. The benzene concentration has remained below the 0.002 mg/l method-reporting limit in NMG MW-9 since September 2007 and in NMG MW-8 since September 2008. The benzene concentration in NMG MW-6, located along the eastern edge of the northern part of the plume, remained below the 0.002 mg/l method reporting limit for the second monitoring event.

Wells NMG MW-5 is the closest well to the source area along the groundwater flow path. Its benzene concentration exhibits a general decreasing trend that began in the second quarter of 2008 although it exhibited a slight increase this monitoring event. The benzene concentrations in NMG MW-10 remain stable. The concentration also remained stable in MW-7 after increasing between the second and third quarters of 2009. All three of these wells are in the interior of the plume

The benzene concentration increased in NMG MW-12 at the southern edge of the plume after an extended decline. Its concentration remained below the NMWQCC Groundwater Standard for the fourth consecutive quarterly sampling event.

The trends described above demonstrate that the dissolved phase hydrocarbon north area plume did not expand between December 2009 and March 2010 although slight increases were measured in several wells.

Central Area

Figure 8 graphs the benzene-time relationship for six wells in the central part of the site. Wells MW-M and MW-O are located adjacent to the MW-27 source area. The concentrations in both of these wells decrease for the third consecutive sampling event.

Well MW-Q is located farther down gradient from the MW-27 source area. The concentration appears to remain stable. The concentration in MW-MM, located down-gradient from the MW-26 source area, decreased to a concentration of 0.0113 that is only slightly above the NMWQCC groundwater standard.

Wells MW-E and MW-I are on the down-gradient margin of the dissolved-phase plume. The concentration in MW-E declined to below the method reporting limit along with MW-I. The above data confirm that the dissolved phase hydrocarbon plume is contracting along its margin in this area.

Wells MW-9, MW-19, MW-28, MW-29, MW-30, MW-31, MW-F and MW-J are all located along the eastern, down-gradient edge of the Huston property. None of these boundary wells contained detectable concentrations of BTEX, again indicative that the plume is not expanding outside of its pre-study boundaries.

South Area

The benzene-time concentrations for the wells in the south area with concentrations above the method reporting limit are shown on Figure 9. Down-gradient boundary wells MW-16, MW-17 and MW-24 have never contained BTEX constituents above the method reporting limits so they are not included.

None of the wells in the south area have exceeded the NMWQCC groundwater BTEX standards since the second quarter of 2008 (Figure 6). The benzene concentrations in MW-A remained below the method reporting limit. The concentrations in MW-1 and MW-4 appear to be varying at trace concentrations below the 0.01 mg/l standard. The concentration in the irrigation well decreased.

The concentrations in the remaining wells are all below the 0.002 method reporting limit. The results for the House Well and MW-5 have not exceeded the method reporting limit since November 2007. The steady downward trend, or variations at low concentrations, in all of the wells shown in Figure 9 demonstrates that the dissolved phase plume in this area is continuing to contract toward the north.

RECOMMENDATIONS

AEC recommends that the FPH removal continue as necessary in wells MW-26, MW-27, MW-N, MW-CC, MW-EE and MW-LL. Removal activities should cease one week prior to sampling to ensure accurate FPH thickness measurements.

The next monitoring episode is scheduled for the first quarter of 2010. Thank you for allowing AEC to complete this work. Do not hesitate to contact me if you have any questions or comments on this report.

Sincerely,
AMERICAN ENVIRONMENTAL CONSULTING, LLC

FIGURES

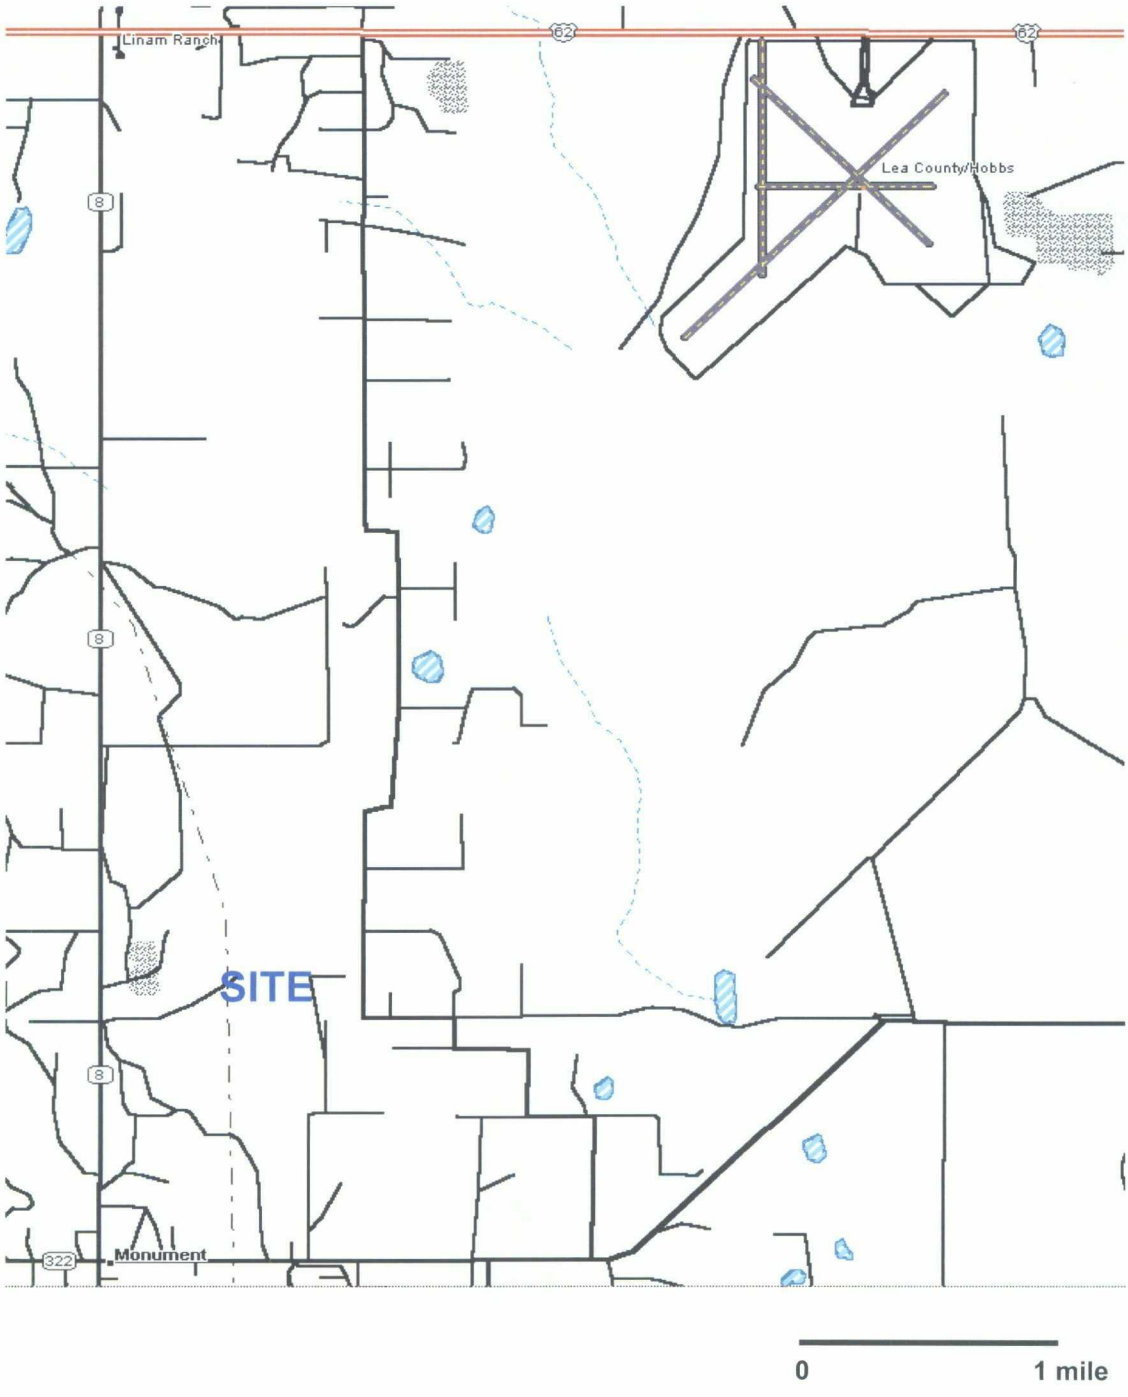

Figure 1 – Site Location Map
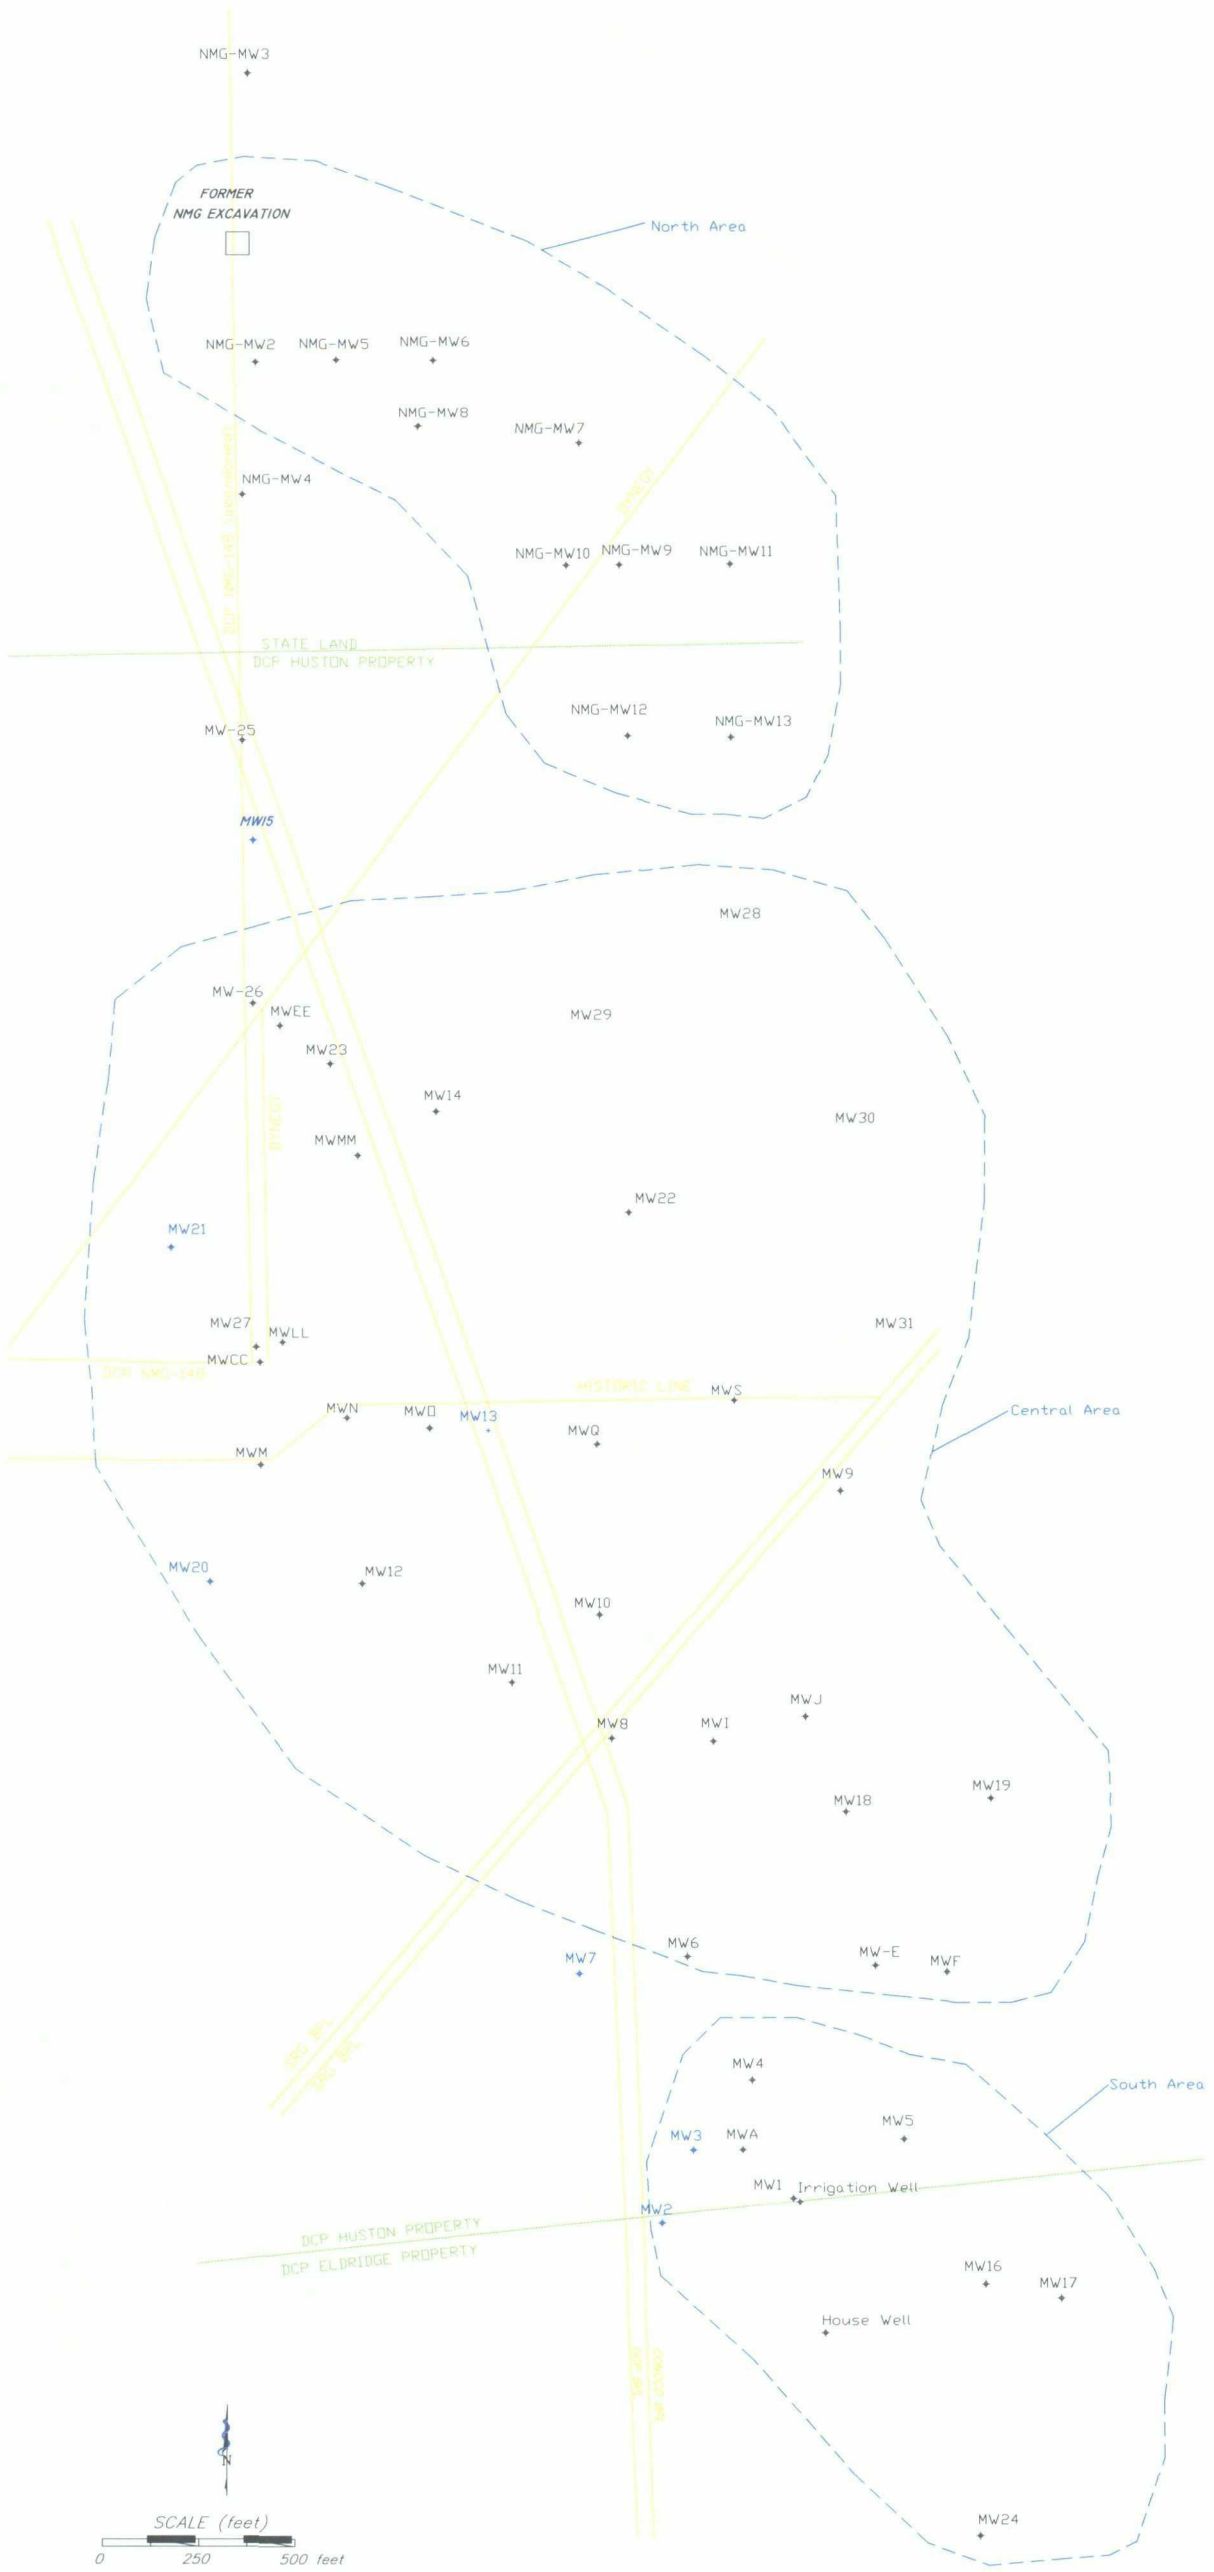
DCP Eldridge Study Area

dcp Midstream

DRAWN BY: MHS
REVISED:
DATE: 1/07



Note:
Wells shown in blue are used for fluid measurement only

Figure 2 - Monitoring Well and Pipeline Locations

DCP Eldridge Study Area

DRAWN BY: MHS

DATE: 6/10

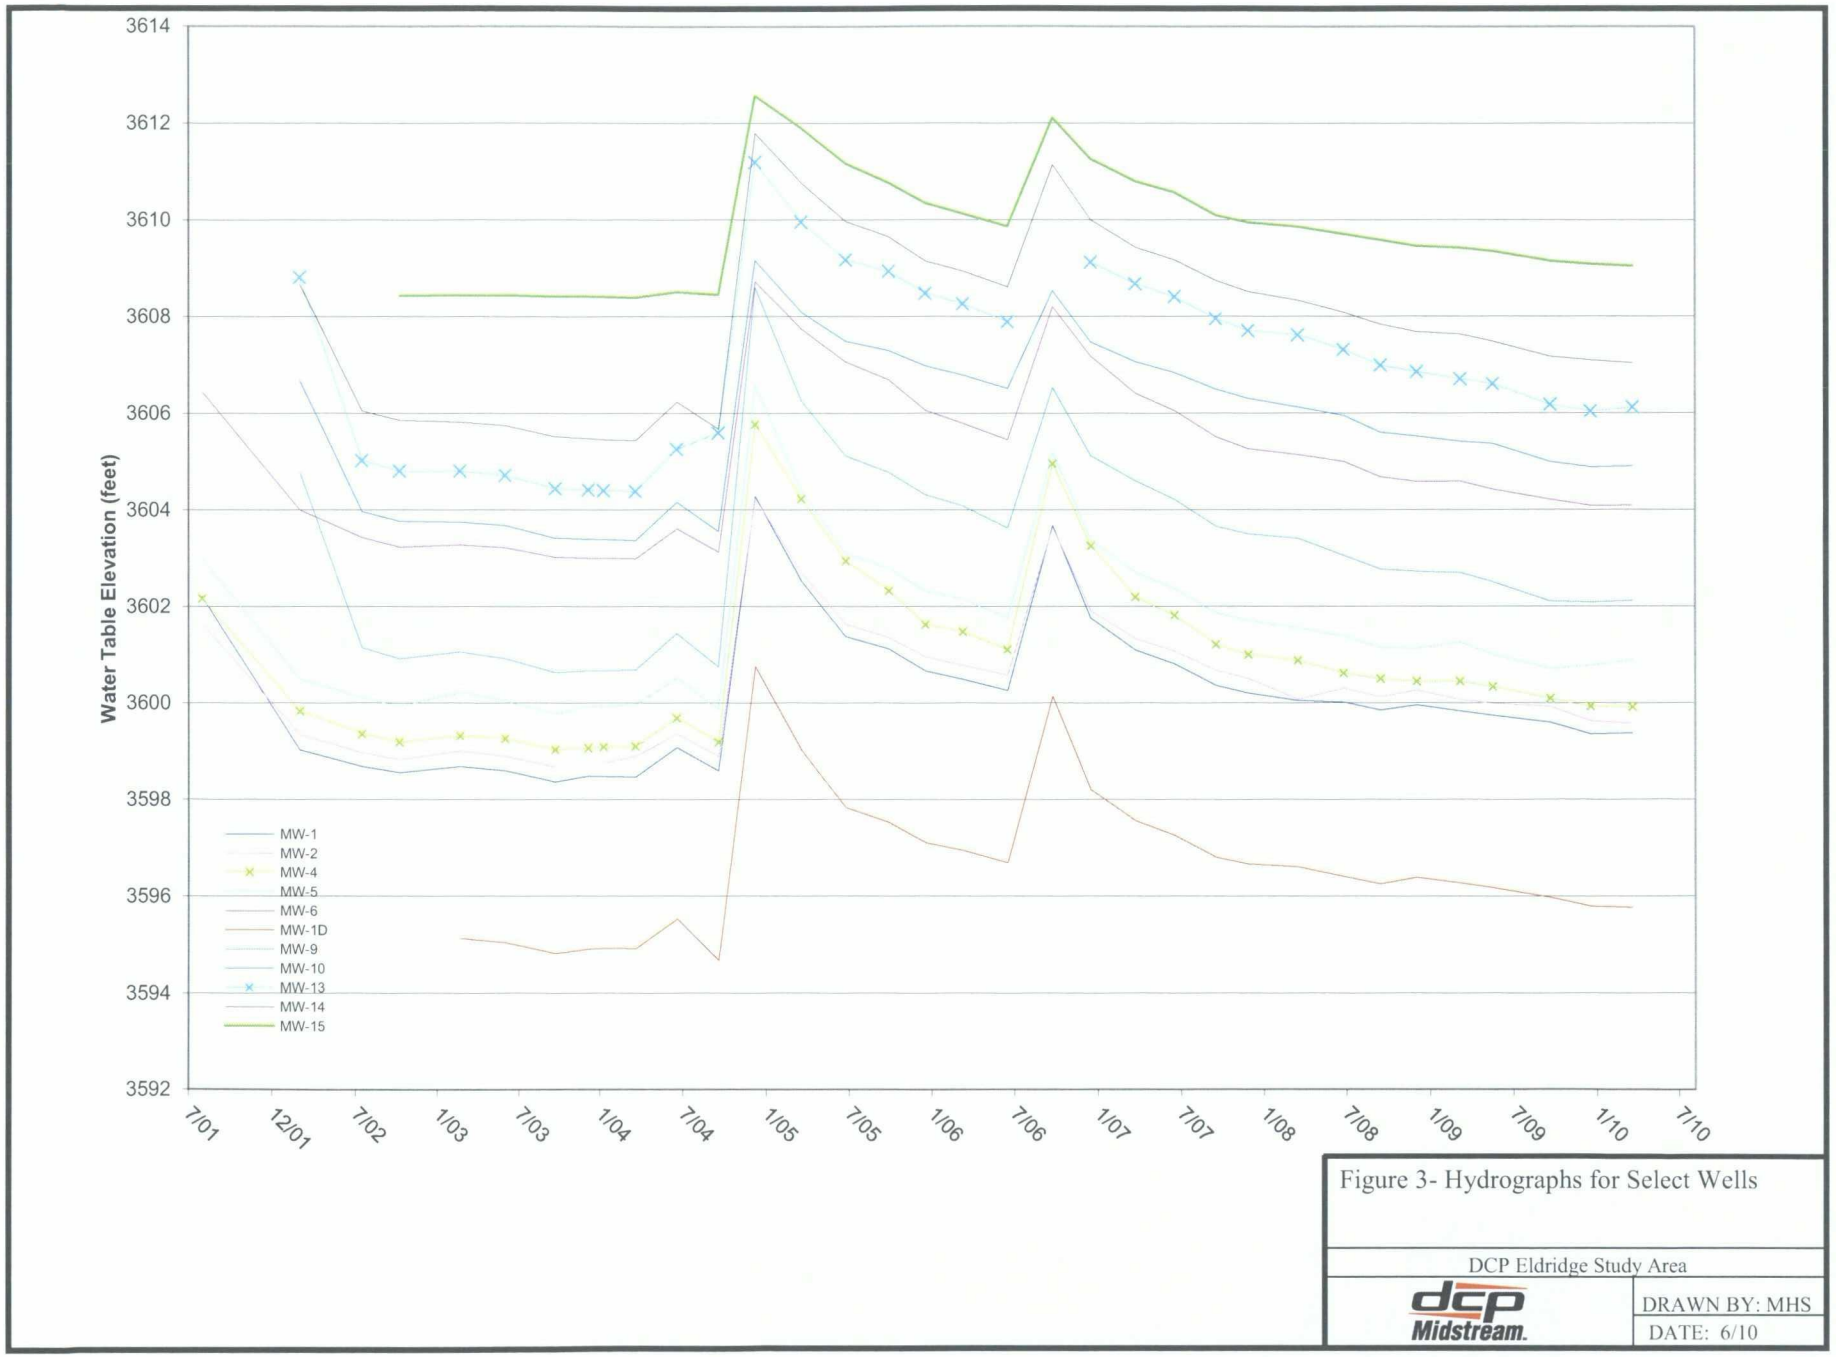


Figure 3- Hydrographs for Select Wells

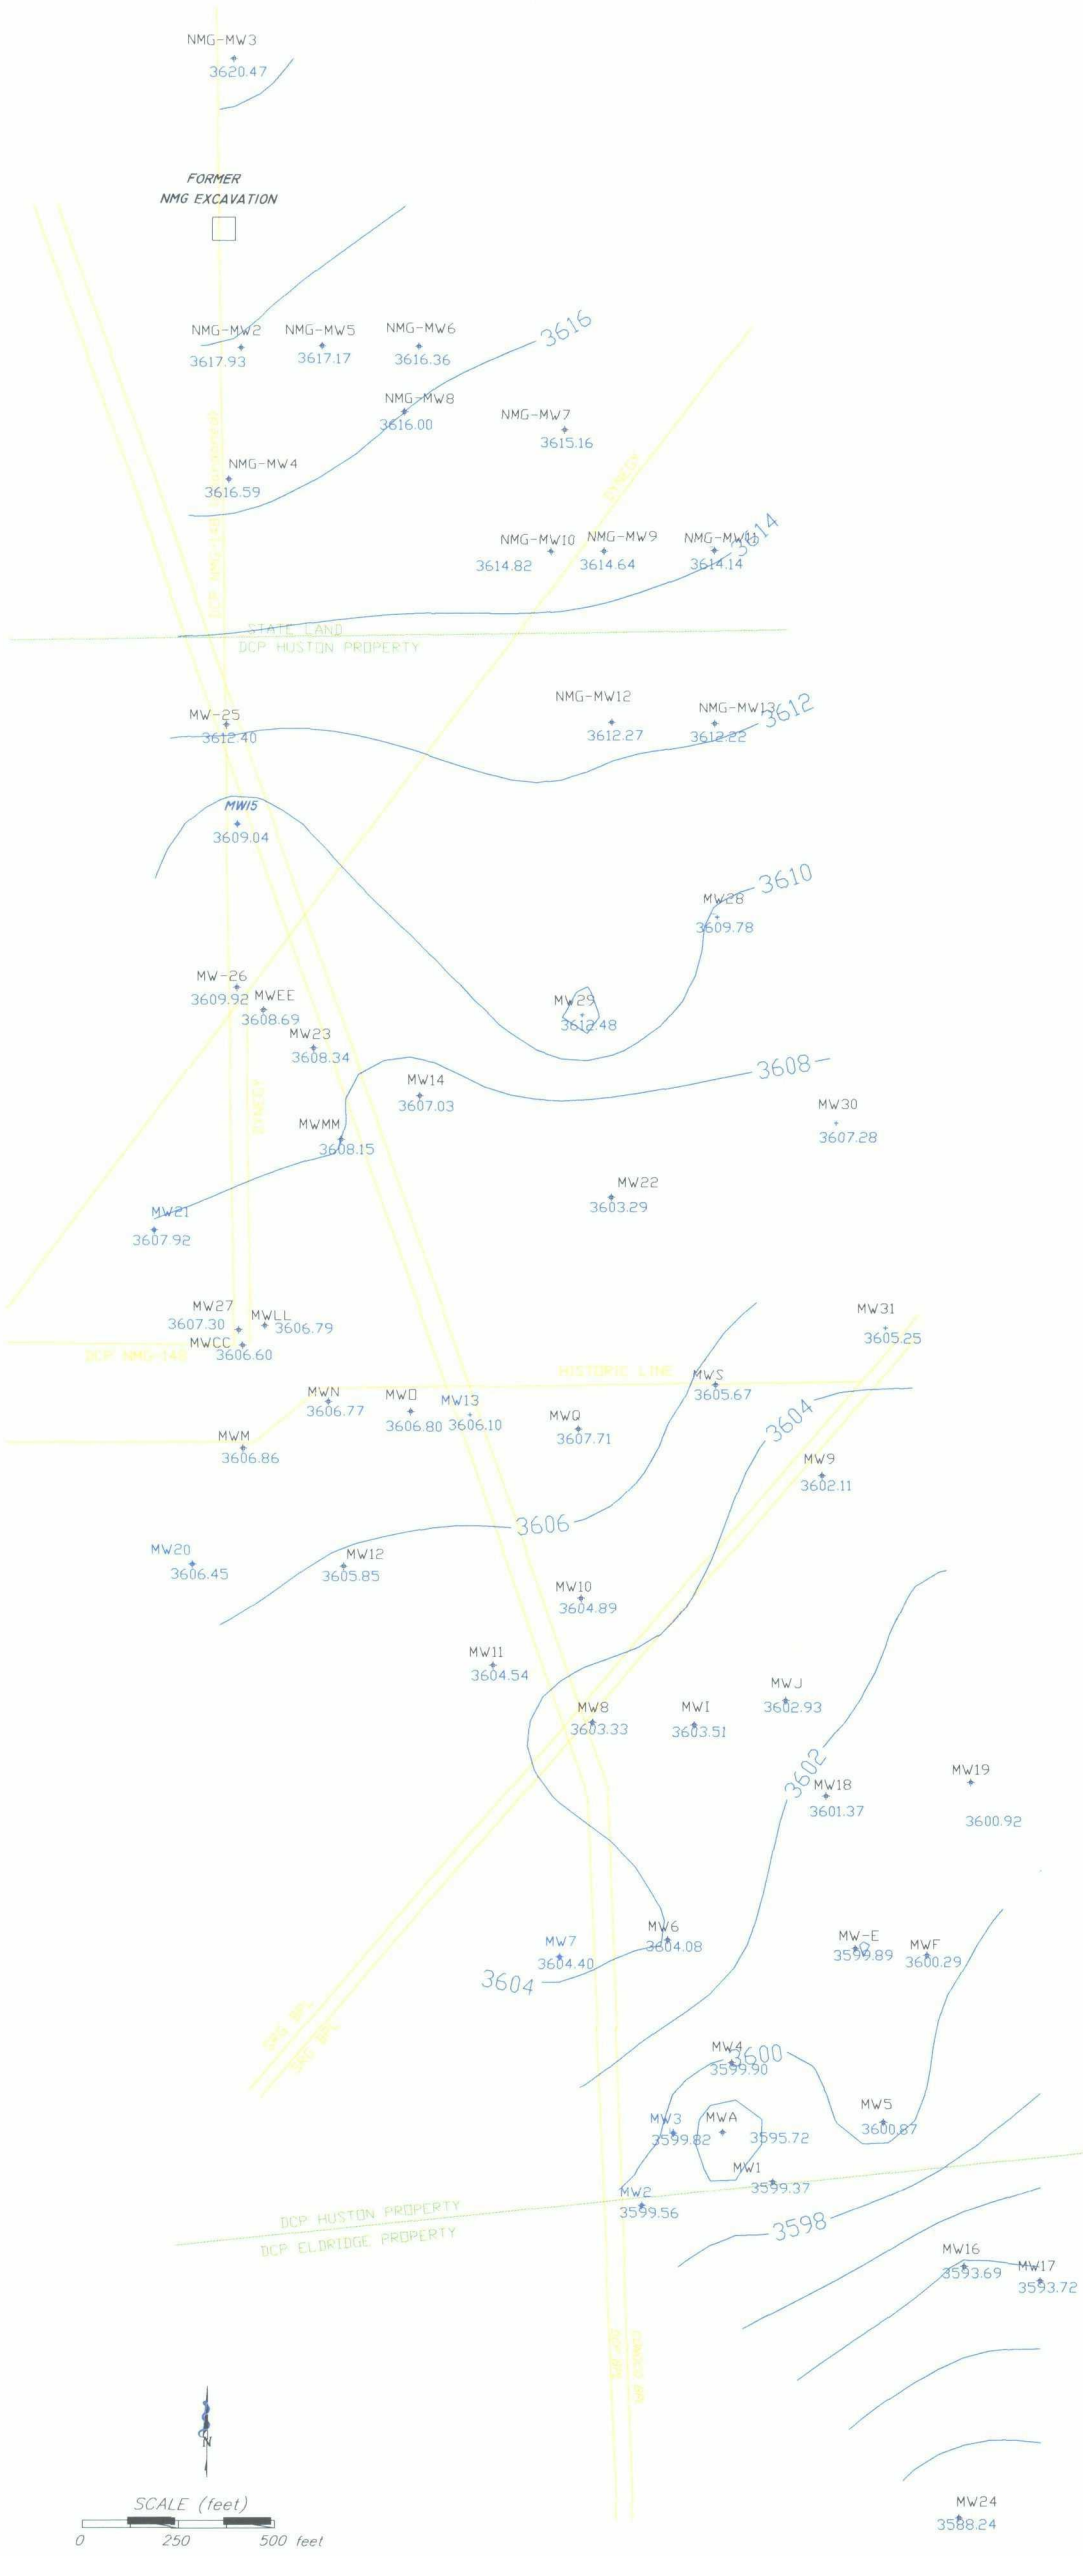
DCP Eldridge Study Area

dcp Midstream.

DRAWN BY: MHS

DATE: 6/10



Contour interval is 2 feet
Wells with names shown in blue are used for fluid measurement only

Figure 4 – First Quarter 2010 Water Table Contours

DCP Eldridge Study Area

DRAWN BY: MHS

DATE: 6/10

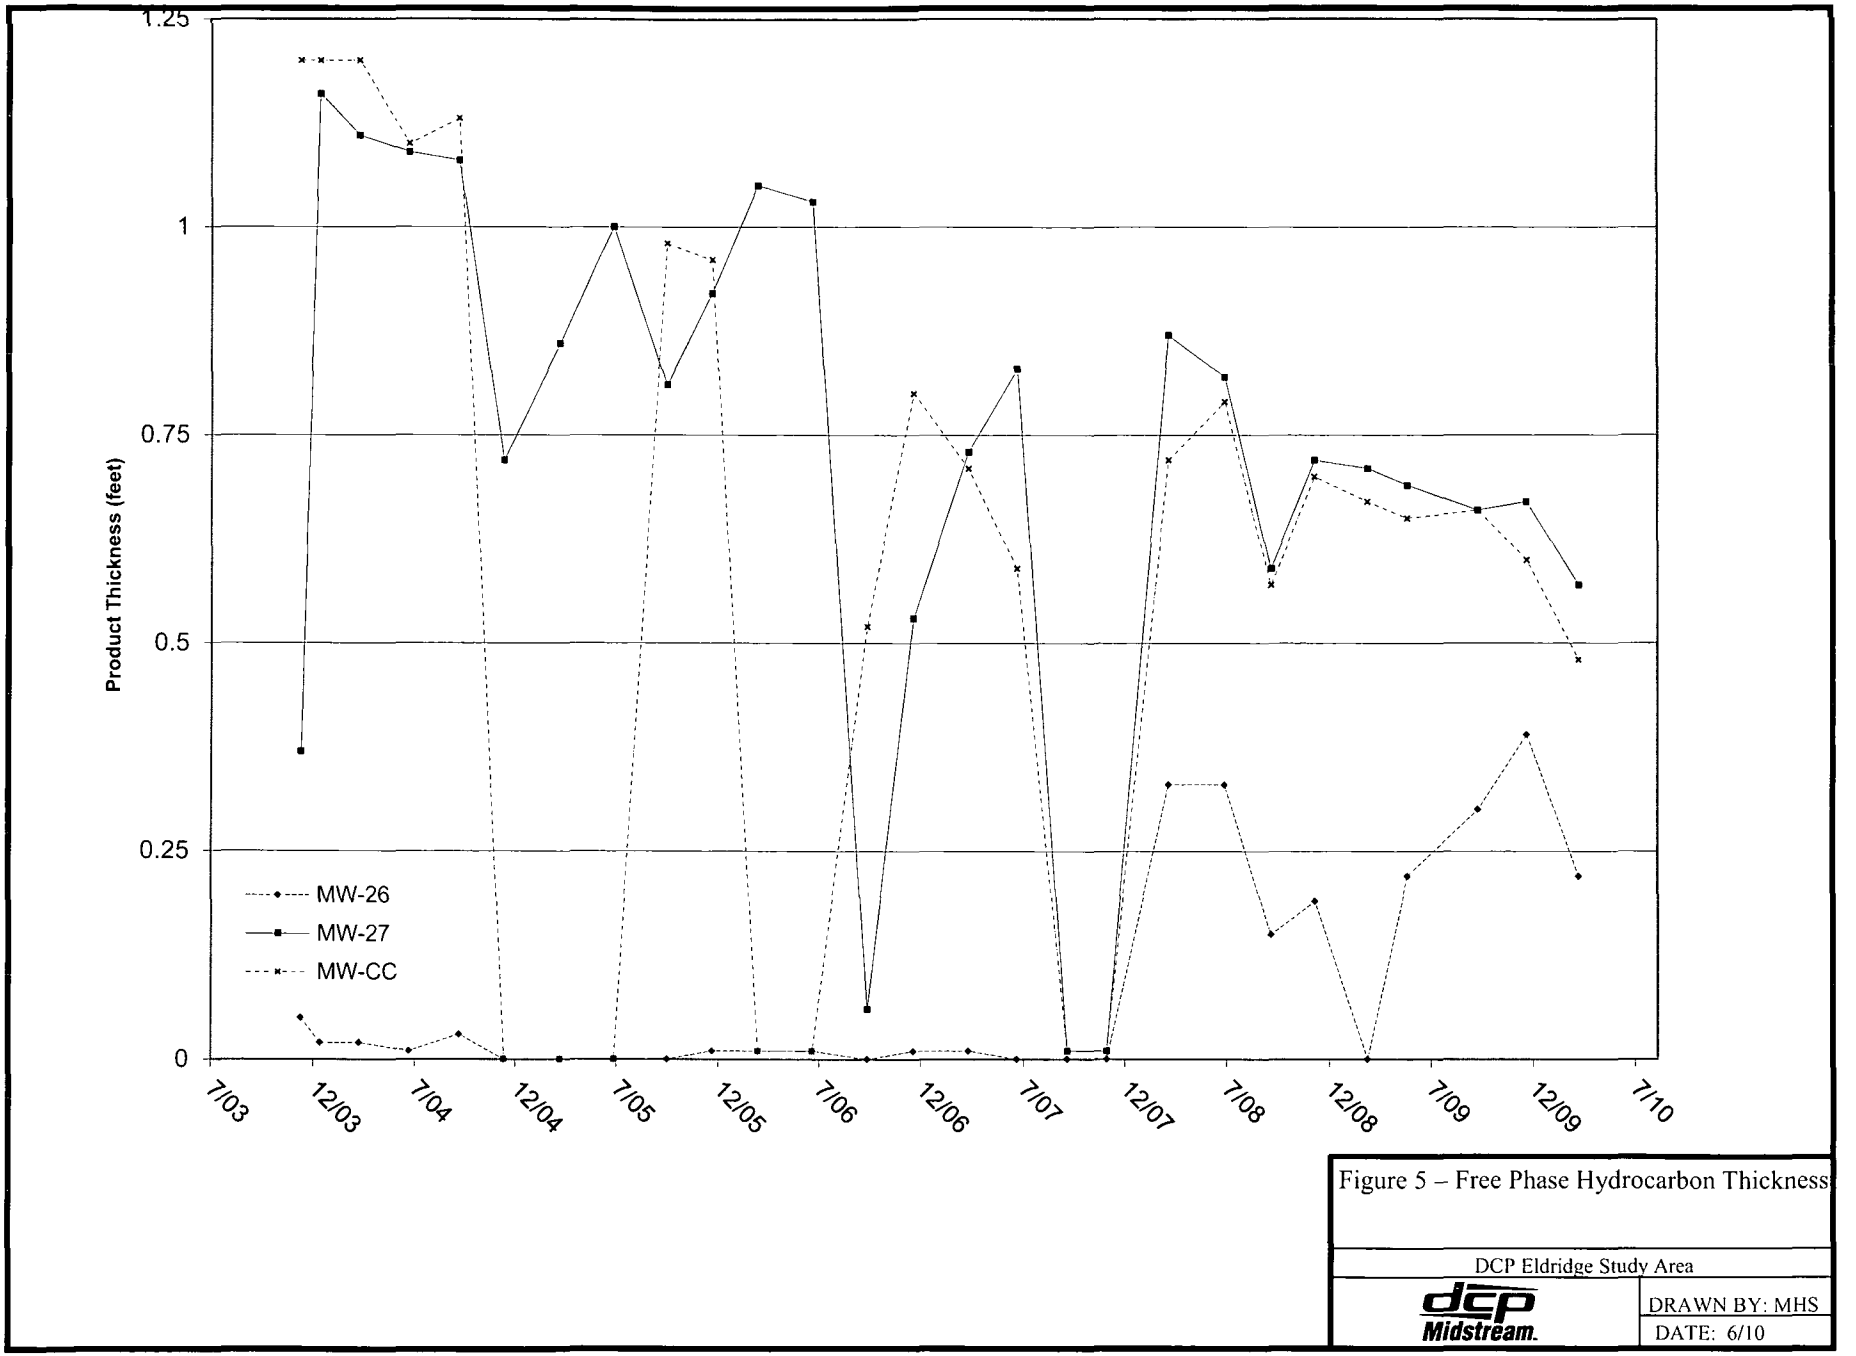


Figure 5 – Free Phase Hydrocarbon Thickness

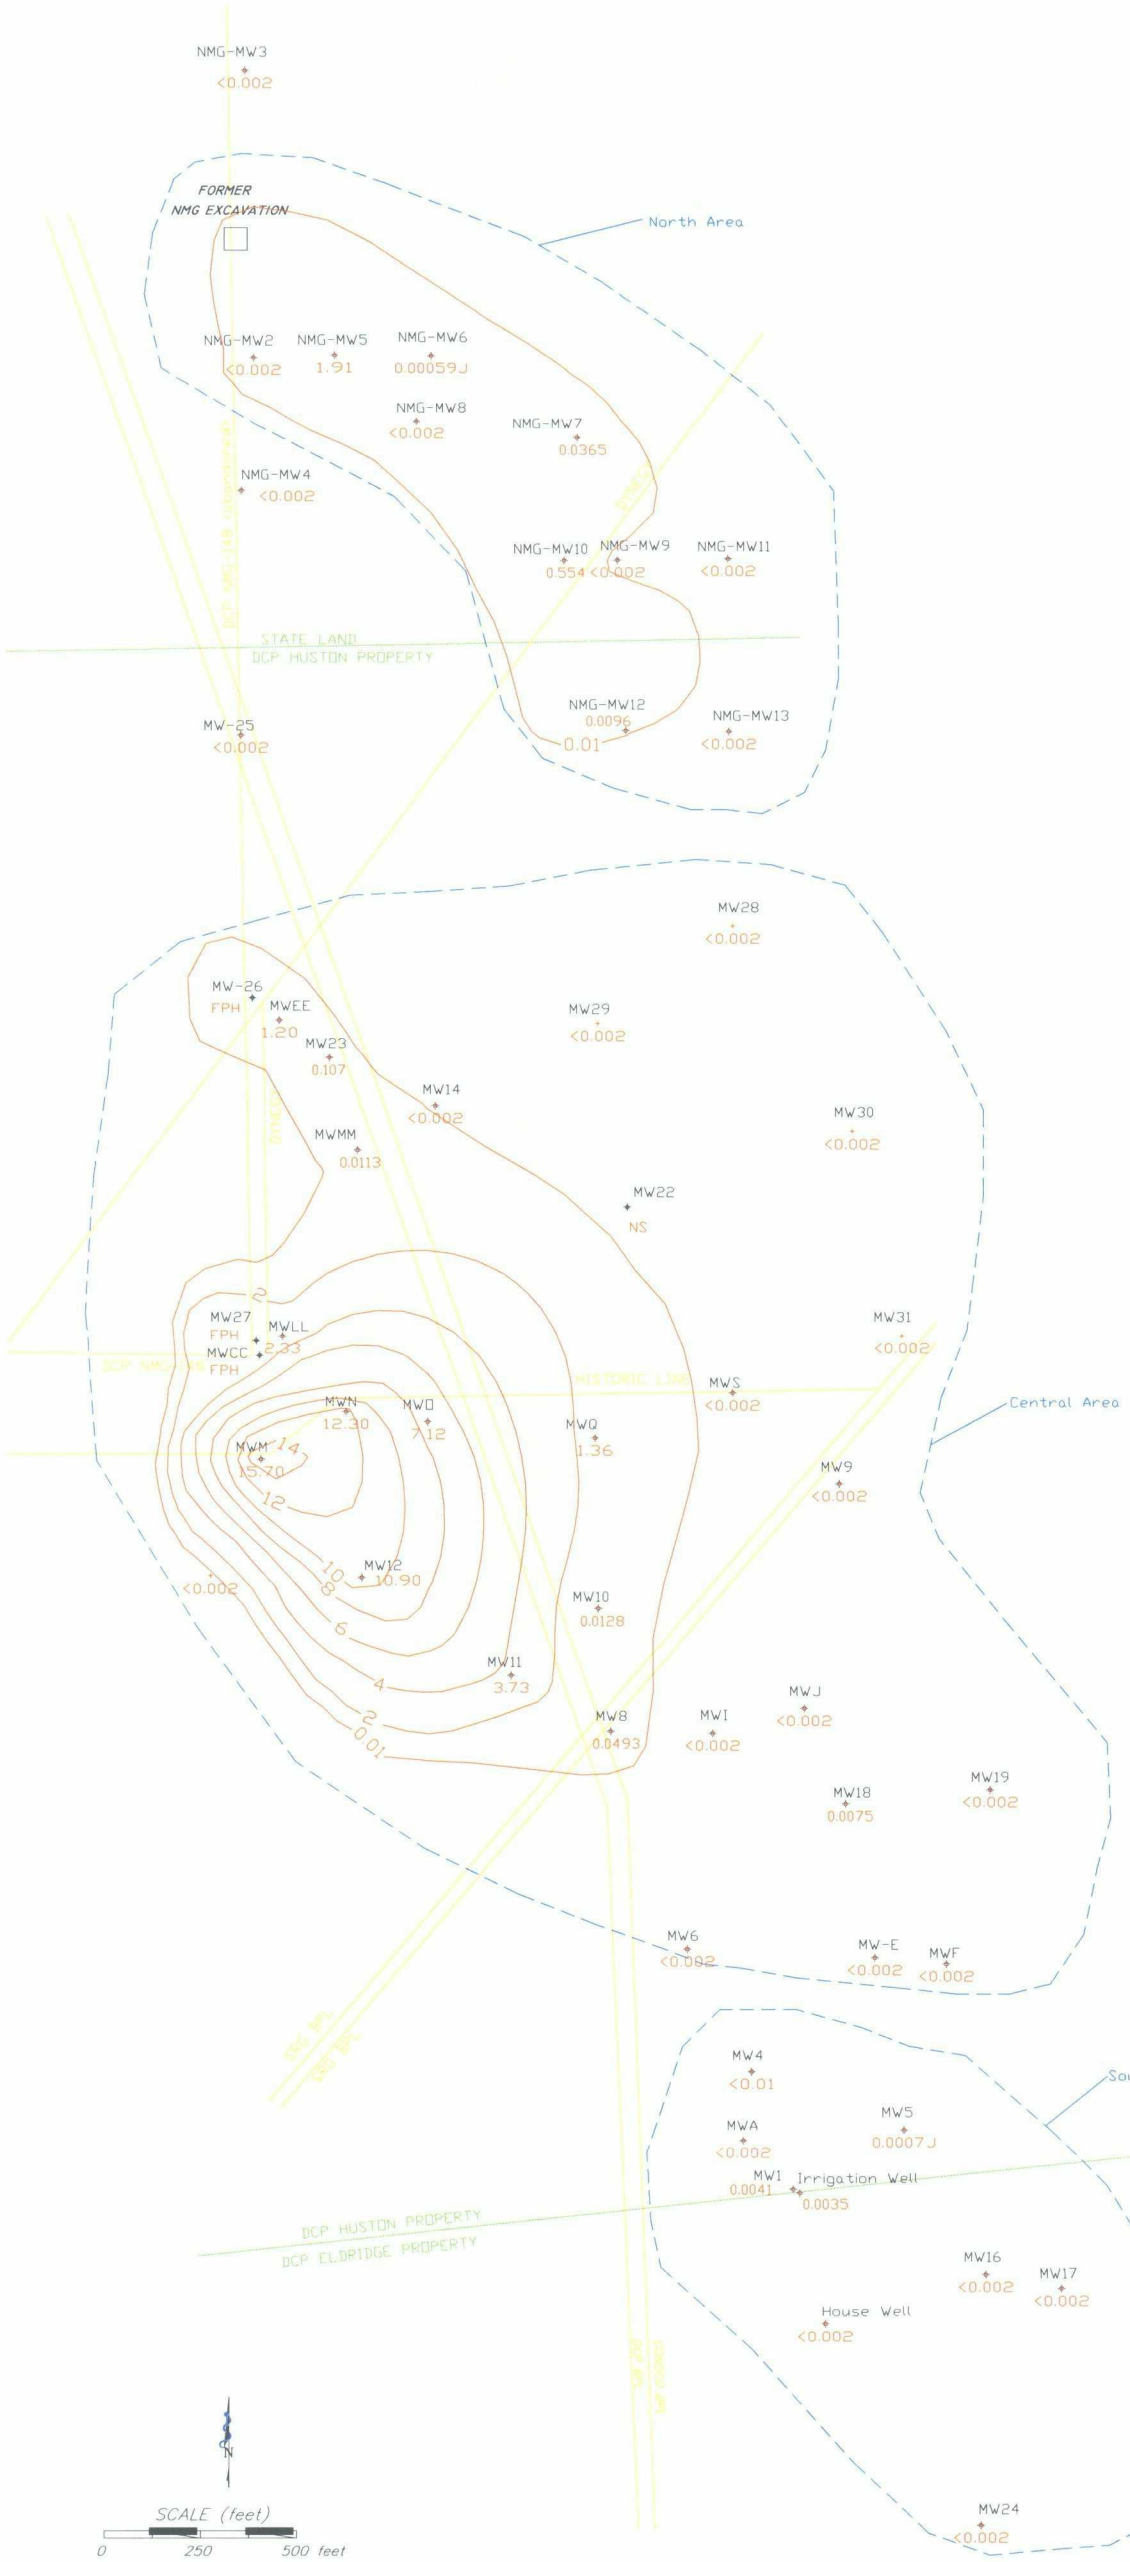
DCP Eldridge Study Area

dcp Midstream.

DRAWN BY: MHS

DATE: 6/10



NOTES

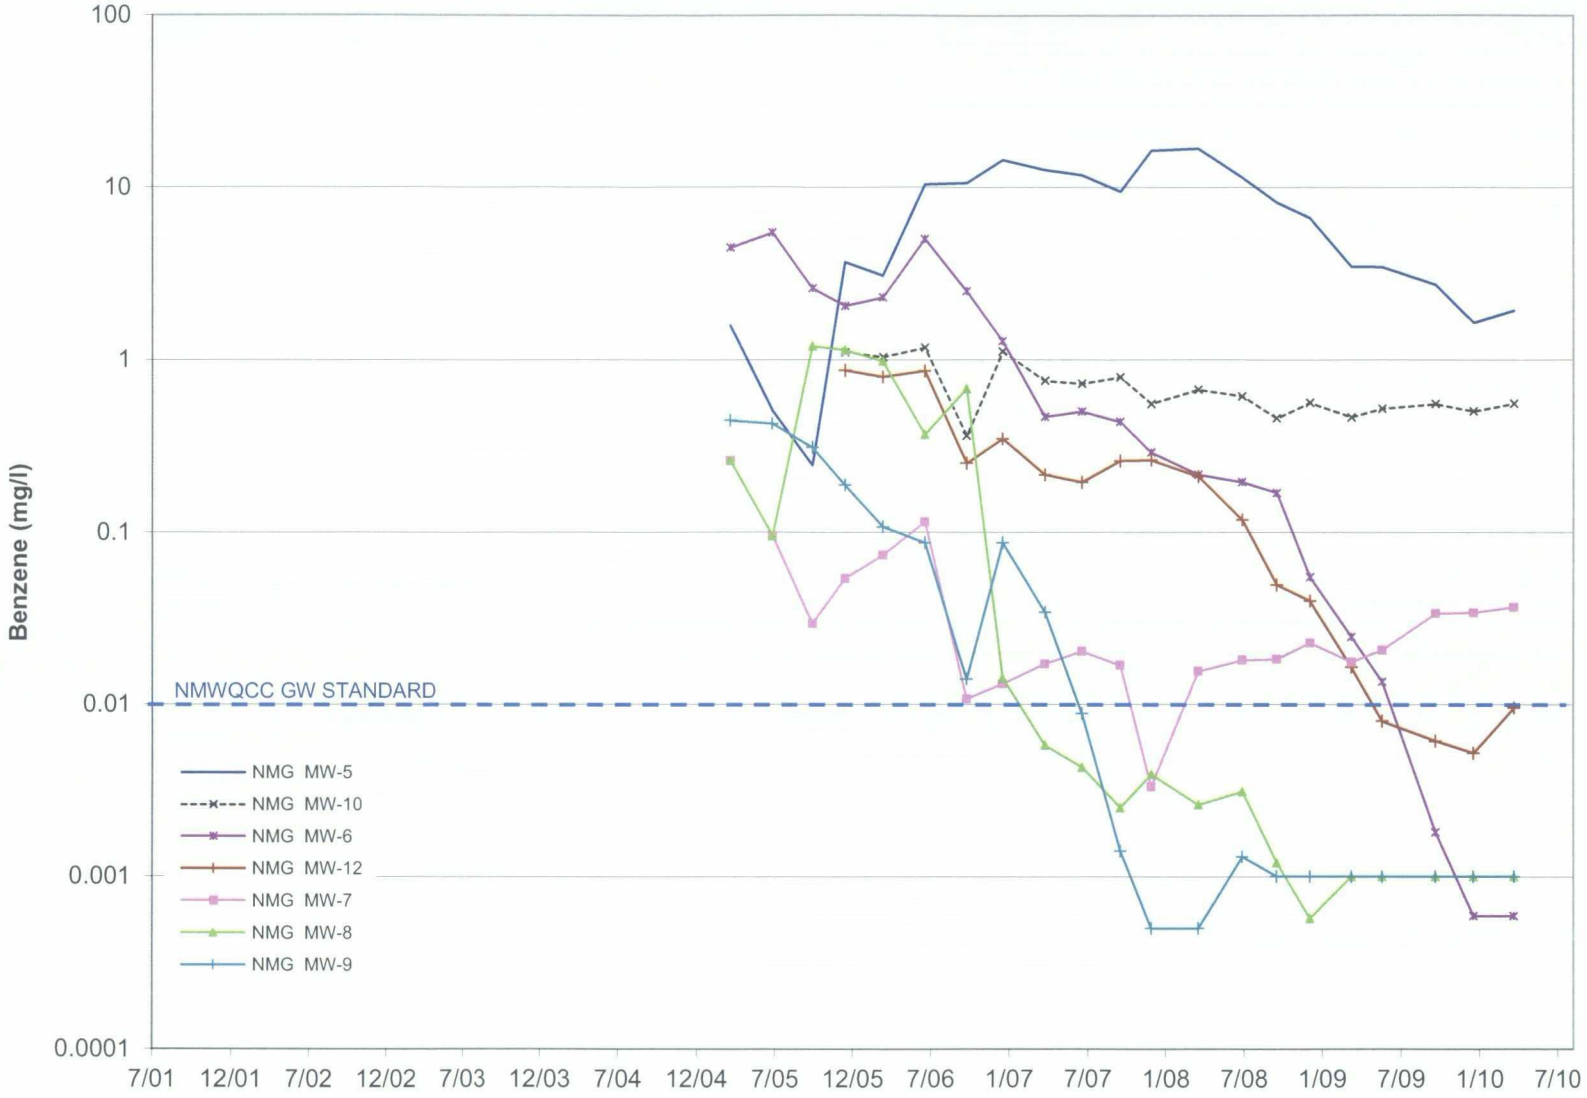
1) Contour interval is 2 mg/l with a additional 0.01 mg/l boundary for the New Mexico Water Quality Control Commission Groundwater Standard
2) Wells containing free phase hydrocarbons are denoted as FPH and were not sampled
3) Duplicate values above the method reporting limit were averaged together
4) NS on MW-22 notes that it was not sampled because of root blockage
5) DCP purchased the Huston property in June 2010 after this sampling event was completed

Figure 6 – First Quarter 2010 Benzene Isopleths

DCP Eldridge Study Area

DRAWN BY: MHS

DATE: 6/10



Values shown at or below 0.001 mg/l are generally listed as below the method reporting limit.

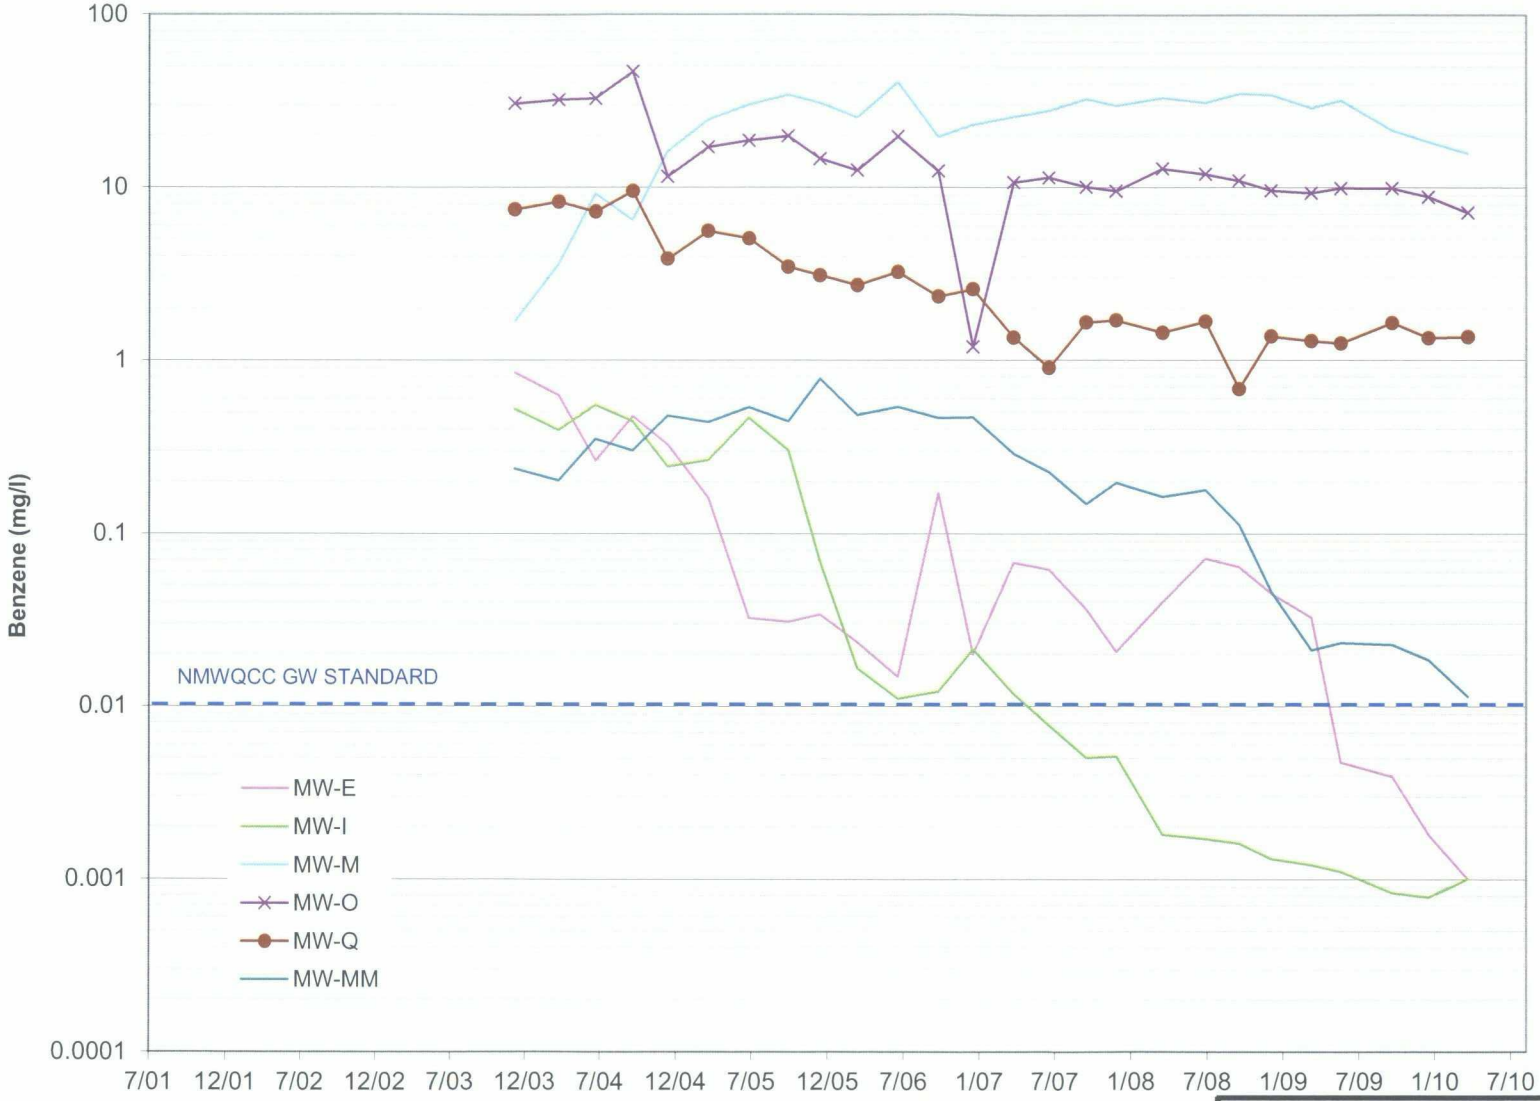
Figure 7 – Benzene-Time Graph for Select Wells in the North Area

DCP Eldridge Study Area

dcp Midstream.

DRAWN BY: MHS

DATE: 6/10



Values shown at or below 0.001 mg/l are generally listed as below the method reporting limit.

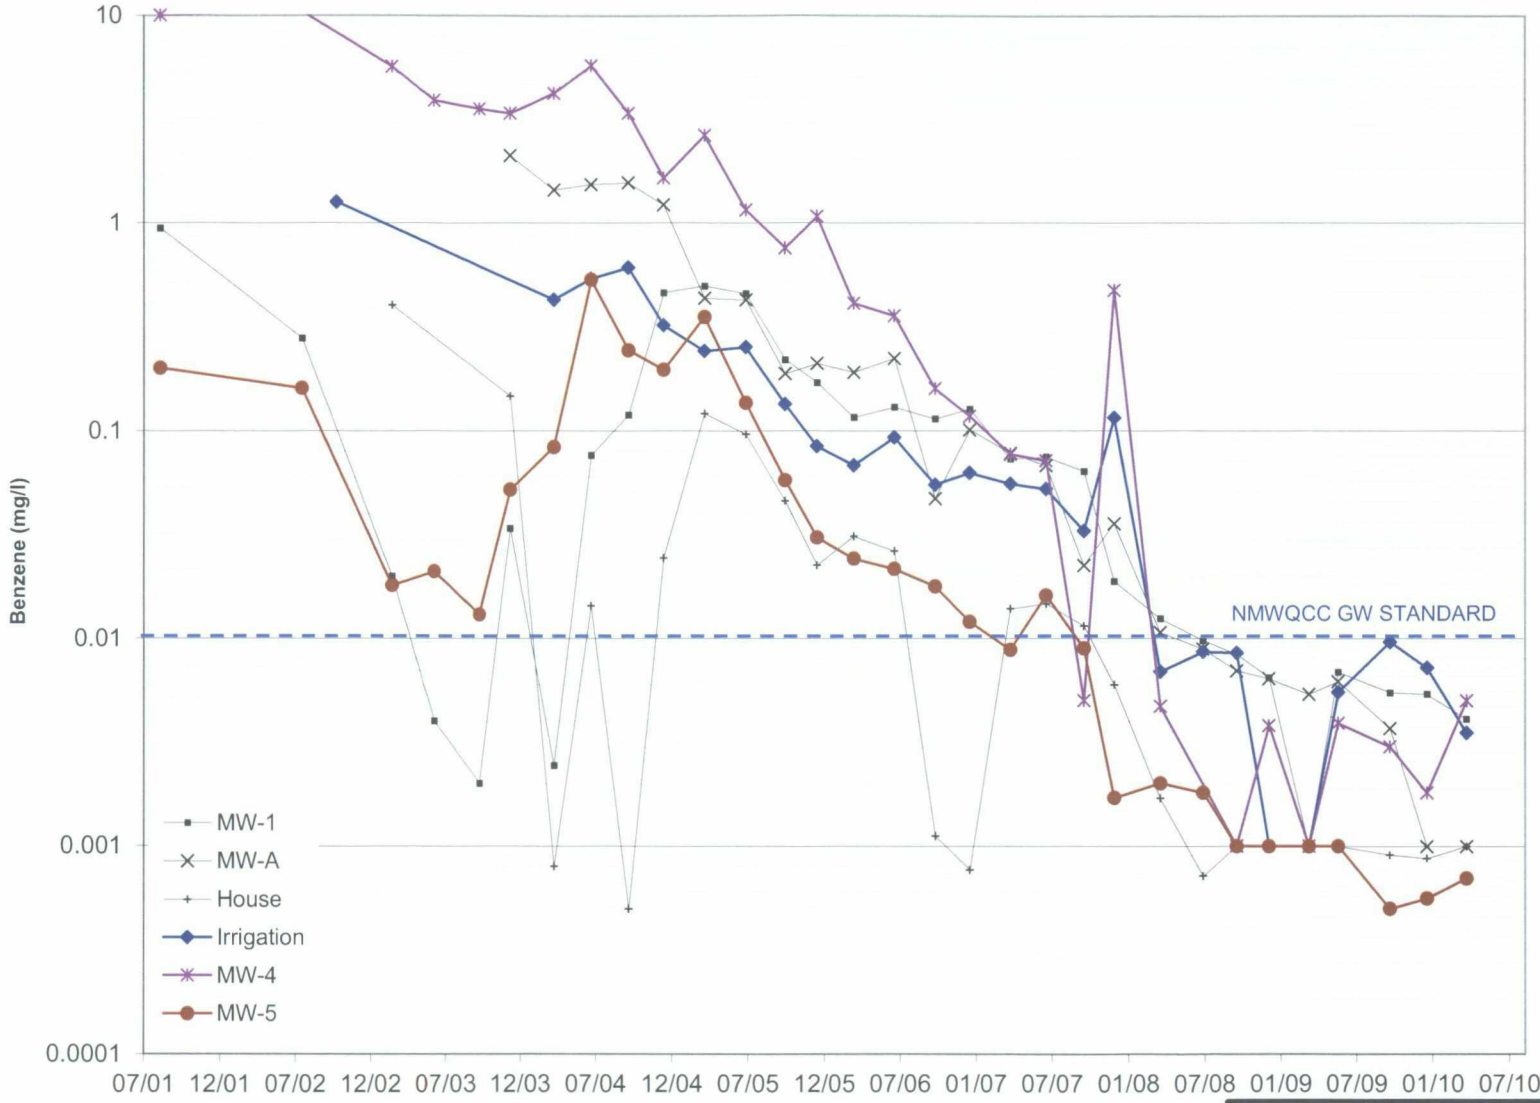
Figure 8 – Benzene-Time Graph for Select Wells in the Central Area

DCP Eldridge Study Area

dcp Midstream.

DRAWN BY: MHS

DATE:6/10



Values shown at or below 0.001 mg/l are generally listed as below the method reporting limit.

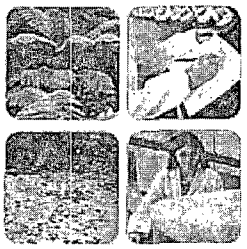
ANALYTICAL LABORATORY REPORT

Gulf Coast ACCUTEST Laboratories

IT'S ALL IN THE CHEMISTRY

04/14/10



Technical Report for

DCP Midstream, LLC

AECCOLI: DCP Midstream Eldridge

DCP MIDSTREAM ELDRIDGE

Accutest Job Number: T49803

Sampling Date: 03/23/10

Report to:

American Environmental Consulting

mstewart@aecdenver.com

ATTN: Mike Stewart

Total number of pages in report: **106**

ACCUTEST LABORATORIES 50 YEARS 1956-2006

ACCREDITED IN ACCORDANCE WITH nelac

Test results contained within this data package meet the requirements of the National Environmental Laboratory Accreditation Conference and/or state specific certification programs as applicable.

Paul K Canevaro

Paul Canevaro
Laboratory Director

Client Service contact: Georgia Jones 713-271-4700

Certifications: TX (T104704220-09C-TX) AR (88-0756) FL (E87628) KS (E-10366) LA (85695/04004) OK (9103) UT(7132714700)

Test results relate only to samples analyzed.
