Historical release areas were discovered subsequent to wellsite abandonment activities. Hydrocarbon and produced water-impacted soils located in the area of wellsite facilities were identified for removal to disposal. A corrective action plan was submitted to NMOCD District 1 office and Remediation Plan number 10-1-2395 was assigned. Five soil borings were advanced to depths of 30 feet at the site and 15 samples were collected and analyzed to verify contaminate levels for NMOCD and to delineate targets for excavation purposes. No soil boring sample concentrations exceeded RRALs for the site. 200 cubic yards of impacted materials were removed for disposal at Parabo facility in Eunice, New Mexico. Four confirmation samples collected exhibited concentrations below RRALs. Disturbed areas were backfilled with clean soil provided by landowner and ground surface was planted using native seed mixture (#2)

1.0 INTRODUCTION

Conestoga-Rovers and Associates (CRA) herewith submits this **Final Report** under Remediation Plan # 10-1-2395, on behalf of Oxy USA, Inc. (Oxy) and Glenn Springs Holdings, Inc. (GSH) to the New Mexico Oil Conservation Division (OCD) regarding the abandonment of the above referenced well-site location. The Initial Report of the C-141 Release Notification and Corrective Action Form submitted to the OCD District 1 office is attached for reference (APPENDIX A).

The subject well-site is located within the Myers Langlie Mattix Unit (MLMU) situated between Jal and Eunice, New Mexico. The legal description of the Site is the NW/4 of the NE/4, Section 25, T-23-S, R-36-E with GPS coordinates 32° 16' 50.88" N and 103° 13' 01.45" W (FIGURE 1). CRA understands the surface property is owned by the Myers Family. Depth to groundwater in the vicinity of the subject property is reported by the United States Geological Survey (USGS) to be greater than 100 feet below ground surface (bgs).

The OCD has regulatory jurisdiction over oil and gas production operations including pipeline spill/closure in the State of New Mexico. This project was conducted under the regulatory jurisdiction of the OCD, which requires that soil impacted by a crude oil spill be remediated in such a manner that the potential for future affects to groundwater or the environment are minimized. The OCD hydrocarbon remediation levels are determined by ranking criteria on a site-by-site basis, which is outlined in the OCD *Guidelines for Remediation of Spills, Leaks, and Releases*, dated August 13, 1993. The ranking criteria are based on three site characteristics: depth to groundwater, wellhead protection and distance to surface water and values for the site are presented below.

CHARACTERISTIC	SELECTION	SCORE
Depth to Groundwater	> 100 feet	0
Wellhead Protection Area	>1,000 feet	0
Distance to Surface Water	>1,000 feet	0

Total Ranking Score = 0

Based on these Site characteristics and associated OCD ranking criteria, the following hydrocarbon recommended remediation action levels (RRALs) apply at the #11 MLMU site: benzene- 10 ppm, Total BTEX- 50 ppm and TPH- 5,000 ppm.

2.0 SOIL INVESTIGATION AND REMEDIATION SUMMARY

On February 10, 2010 CRA installed five soil borings at selected locations as shown on FIGURE 2 at the release site to evaluate the horizontal and vertical extent of hydrocarbon and chloride-impacted soils. Soil samples were analyzed from the 4-5', 14-15' and 29-30' intervals in the borings. The subsurface soil boring log data is presented in APPENDIX B. The samples selected for chemical analysis were transferred to laboratory supplied sample containers, labeled and placed on ice in a cooler. Appropriate chain-of-custody protocols were followed in the shipping of the samples to the laboratory. The samples were analyzed for total petroleum hydrocarbons (TPH) including gasoline-range organics (GRO), diesel-range organics (DRO), and oil-range organics (ORO) by EPA Method 8015 modified. In addition, analysis of benzene, toluene, ethylbenzene and xylenes (BTEX) by EPA Method 8021B and chloride analysis by EPA Method 300 were performed. The soil boring sample analytical results are presented in TABLE 1. None of the soil sample concentrations exceeded the RRALs for this location and chloride concentrations did not exceed 60 mg/kg in the 15 samples analyzed. Based on the soil boring results, impacts were limited to surface areas and did not extend significantly into the subsurface at the sampled locations.

Remediation activities were performed at the site between March 17 and 26, 2010. A total of 200 cubic yards of impacted materials were hauled to the OCD-permitted Parabo (Sundance Services, Inc.) facility in Eunice, New Mexico. Non-hazardous waste manifests documenting this activity are presented in APPENDIX C. Four confirmation sample locations collected subsequent to soil removal operations are shown in FIGURE 3. The analytical results are presented in TABLE 1. None of the soil sample concentrations exceeded the RRALs for this location ad chloride concentrations did not exceed 198 mg/kg in the samples analyzed. Laboratory reports for all samples are included in APPENDIX D. The shallow remedial excavations were backfilled with 200 cubic yards of clean soils provided from the MLMU topsoil pit by the property owner, Mr. Kelly Myers. The topsoil was then plowed and a native soils mixture (#2) was planted in an effort to restore vegetative cover on the ground surface. "Before and after" photographs of the site remediation activities are enclosed as APPENDIX E.

3.0 SITE CLOSURE REQUEST

Based on information provided in this report and the final C-141 report form, CRA respectfully requests, on behalf of Oxy and GSH, a NMOCD determination of 'no further action is required' regarding this Final Report for Remediation Plan 10-1-2395. Please note that this report is an attachment to the final C-141 form version. No additional work is planned for this site at this time.
