Request for Increase in Surface  
Injection Pressure  
Maljamar SWD Well No. 1 (State Lease)  
Vacuum (Grayburg/San Andres) Pool  
Lea County, New Mexico

Department of Energy and Minerals  
Oil Conservation Division  
P. O. Box 2088  
Santa Fe, New Mexico 87501

ATTN: Mr. William J. Lemay  
Division Director

Gentlemen:

Phillips Petroleum Company respectfully requests administrative approval to increase the surface injection pressure from 0 PSI to 1570 PSI for the captioned well in Vacuum Pool. This pressure increase is necessary to dispose of produced water from Phillips' Philmex Lease (State Lease B-2229). Well No. 1 was approved for salt water disposal by Order No. SWD 126.

An injection step rate test was performed on October 6, 1987, which indicates that the formation fracture pressure is greater than 1570 PSIG (surface). Enclosed are a well bore diagram of the subject well, tabulations of data from the step rate test, the Engineering Discussion of the test results, and a fracture correlation curve (rate versus pressure) of the step rate test.

Phillips Petroleum Company operates all offsetting proration units as well as all wells within one-half mile of the captioned well. The mechanical integrity of each such well is sufficient to withstand the increased surface injection pressure at the Maljamar SWD Well No. 1. A plat of the area of review is enclosed.

Request for Increase in  
Surface Injection Pressure  
December 21, 1987  
Page 2

Your early consideration and approval are appreciated. Please direct any questions to me or to Mr. John Currie at (915) 367-1342.

Very truly yours,

L. M. Sanders  
Regulation and Proration Supervisor  
(915) 367-1488

APPLICATION FOR INCREASED INJECTION PRESSURE LIMITATION

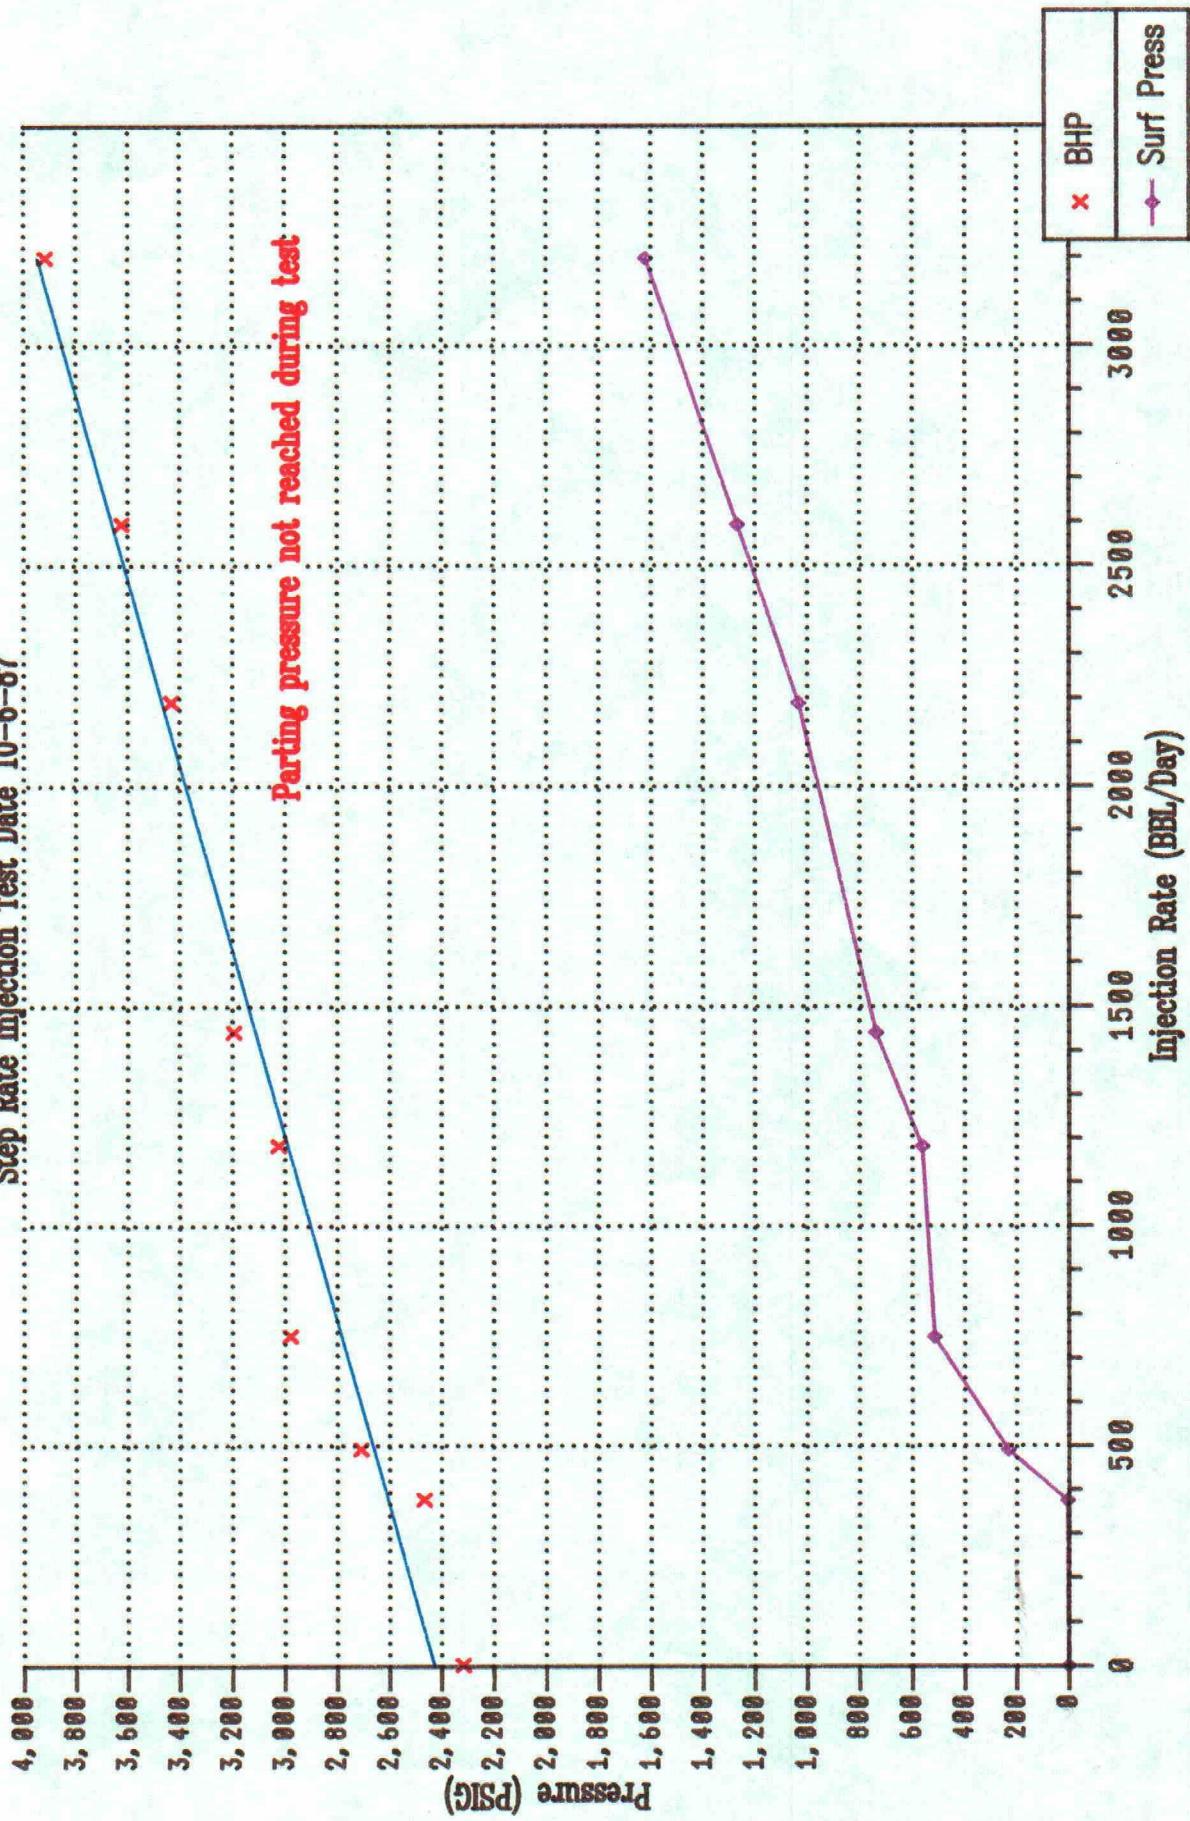

Engineering Discussion

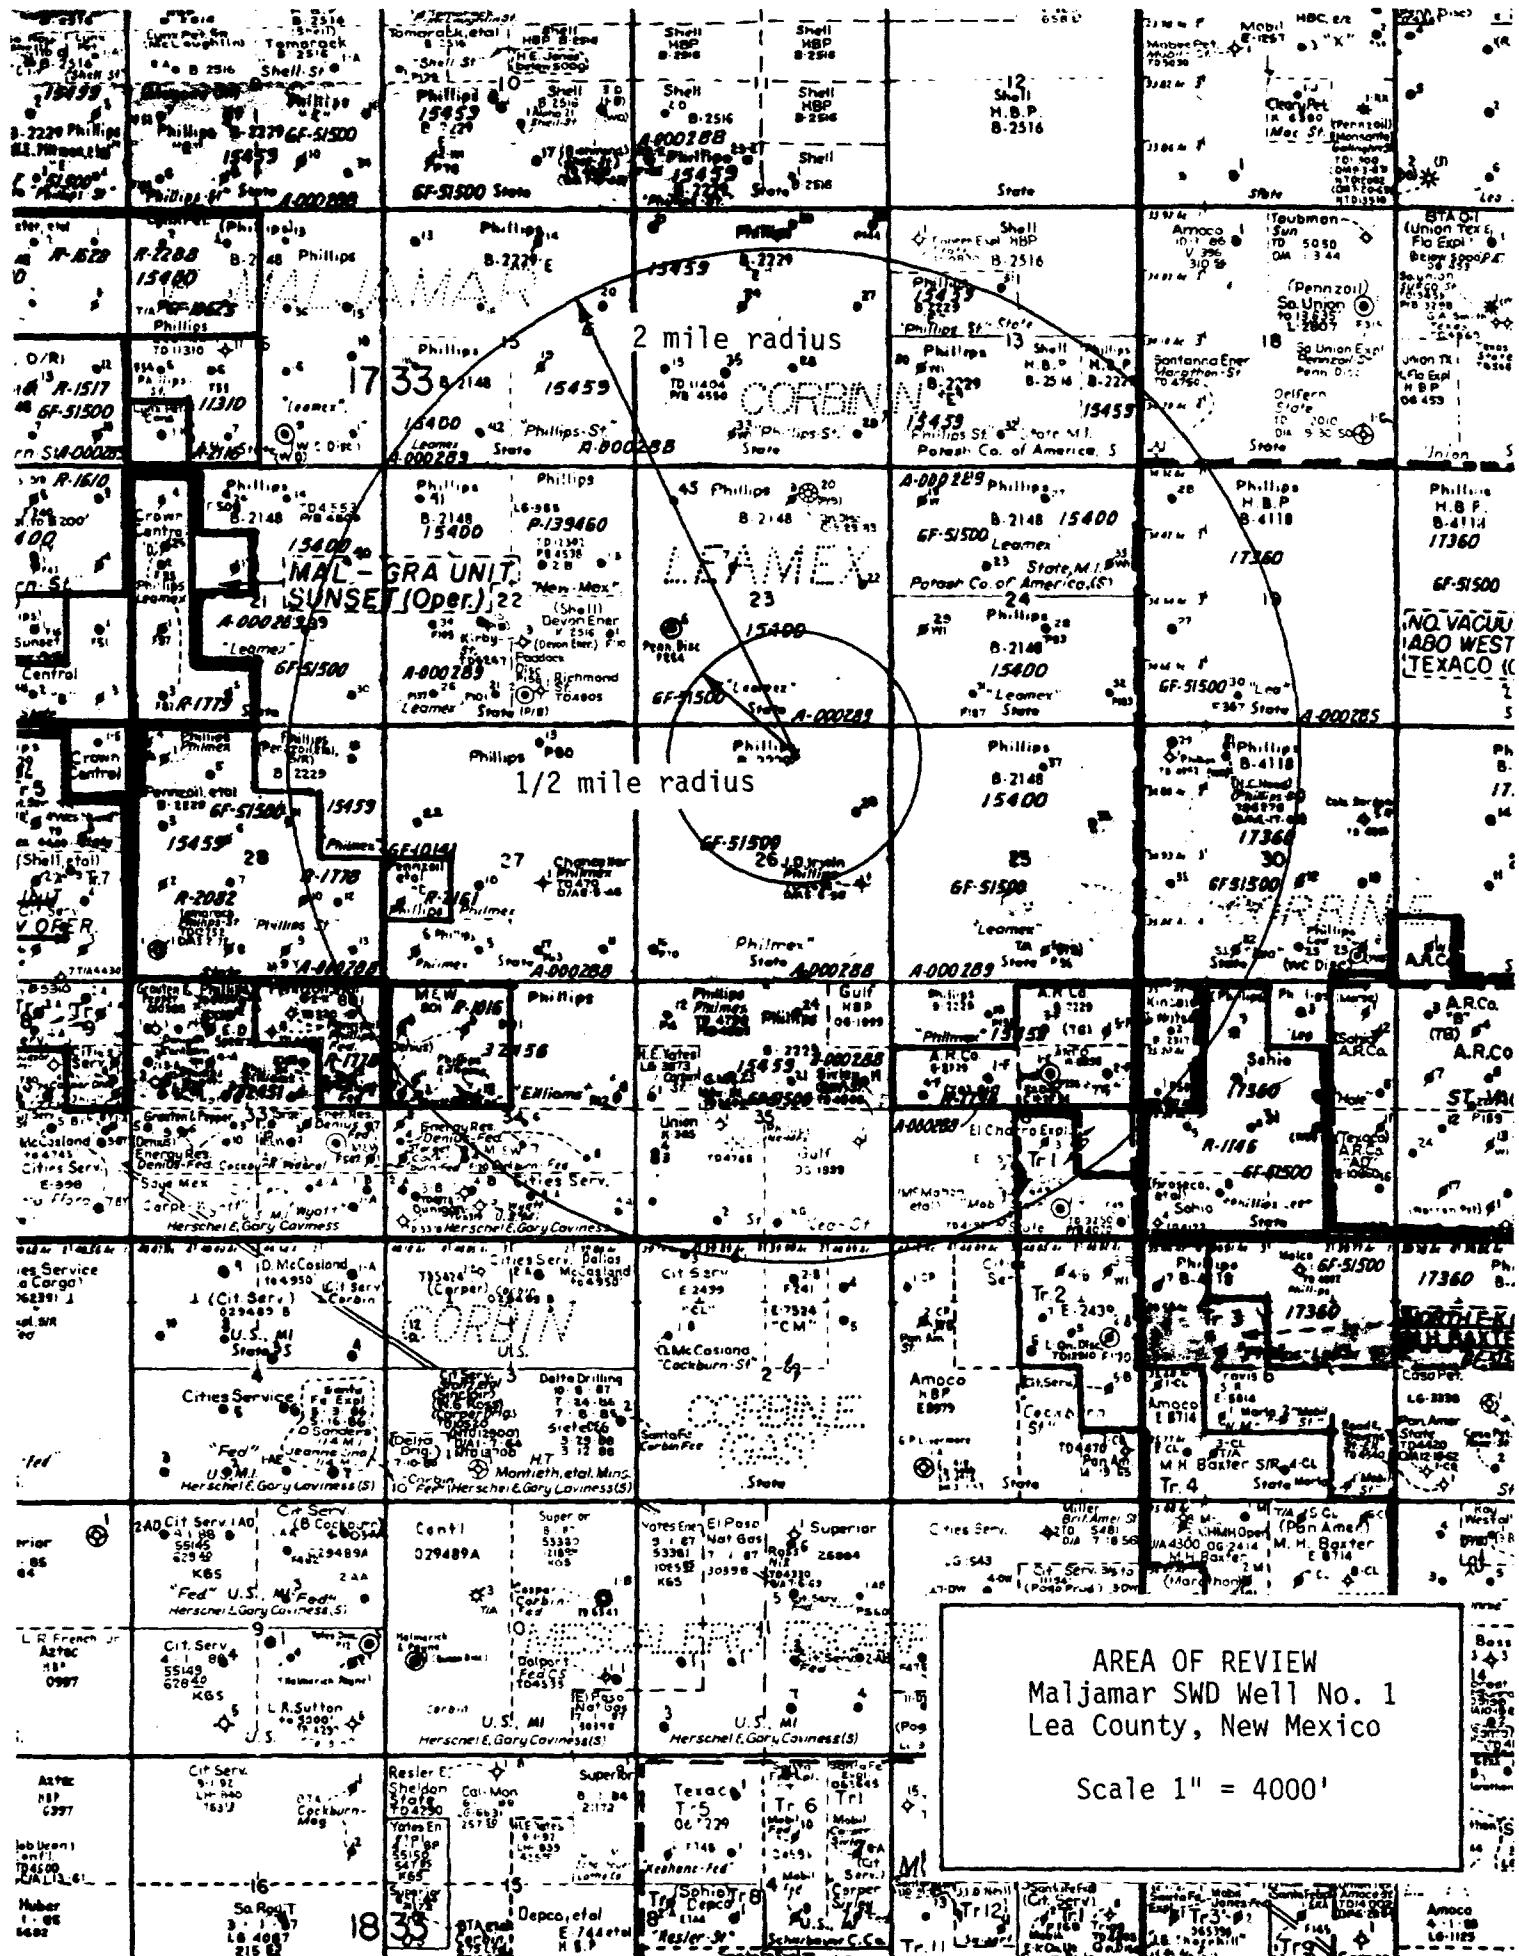

A step rate injection test was performed on the subject well October 6, 1987 by John West Engineering, test data enclosed. As shown on the enclosed well bore diagram, all tubing and down hole equipment was installed at the time of the test. Pressure data came from a surface pressure meter and a bottom hole Amerada bomb. Injection rates were calculated from the flow totalizer. Eight equal step lengths of 30 minutes each were run.

The enclosed plot of surface and bottom hole pressure versus rate indicates that parting pressure was not reached during the test. The highest bottom hole pressure measured was 3918 psi at 5090 ft, yielding a formation fracture pressure gradient greater than 0.77 psi/ft. Limiting the bottom hole pressure to less than 3918 psi will prevent fracturing the formation and will maintain the integrity of the strata confining the injected fluid.

The bottom hole injection pressure of 3918 psi corresponds to a measured surface injection pressure of 1620 psi. Thus, limiting the maximum surface injection pressure to 1570 psi will maintain the integrity of the confining strata. The mechanical integrity of the subject injection well is such that surface injection pressures of this magnitude can be sustained. No other well within one half mile radius penetrates the injection zone. Phillips Petroleum Company requests permission to inject water into the Maljamar SWD Well No. 1 at surface pressures which do not exceed 1570 psi.
