Santa Fe, NM 87505

RE: First 2013 Semiannual Groundwater Monitoring Report
Former DCP Lee Gas Plant (GW-002)
Unit N Section 30, Township 17 South, Range 35 East

Dear Mr. Lowe:

DCP Midstream, LP (DCP) is pleased to submit for your review one copy of the First 2013 Semiannual Groundwater Monitoring Report for the Former DCP Lee Gas Plant located in Lea County, New Mexico (Unit N Section 30, Township 17 South, Range 35 East).

Groundwater monitoring activities were completed June 4 and 5, 2013. The data indicate that the dissolved phase hydrocarbon plume continues to attenuate to below NM WQCC groundwater standards before reaching the down-gradient boundary wells. The next groundwater monitoring event is scheduled for the second half of 2013.

If you have any questions regarding the report, please call at 303-605-1695 or e-mail me CECole@dcpmidstream.com .

Sincerely,

DCP Midstream, LP

Chandler E Cole
Senior Environmental Specialist

First Half Semi-Annual 2013
Groundwater Monitoring Summary Report

Former Lee Gas Plant
Lea County, New Mexico
GW-002

Prepared for:

370 17th St., Suite 2500
Denver, CO 80202

Prepared by:

6899 Pecos Street, Unit C
Denver, Colorado 80221

July 12, 2013

Table of Contents

1. Introduction

This report summarizes the results of the first half semi-annual groundwater monitoring and free phase hydrocarbon removal activities at the Former Lee Gas Plant (Site) in Lea County, New Mexico (Figure 1). Tasman Geosciences, LLC (Tasman) conducted these activities on behalf of DCP Midstream, LP (DCP). The field activities performed during the reporting period were conducted with the purpose of monitoring groundwater flow and quality conditions and assessing the presence of light non-aqueous phase liquid (LNAPL) hydrocarbons in the Site subsurface. Current Site conditions were evaluated from field data and analytical laboratory results collected during the first half of 2013 as well as data collected during previous reporting periods.

2. Site Location and Background

The Site is located in the southwest quarter of the southeast quarter of Section 30, Township 17 South, Range 35 East (approximate coordinates 32.800 degrees north and -103.495 degrees west). It is approximately 0.45 miles southeast of the intersection of US Highway 238 and County Road 50. The area is sparsely populated and land use is primarily associated with livestock grazing and oil and gas production and gathering.

According to information provided in previous Site investigation reports, Lee was historically used as a gas processing and compression plant. In 1988, Phillips 66 Natural Gas Company was ordered to install four monitoring wells (MW-1 through MW-4) in accordance with the Resource Conservation and Recovery Act (RCRA). The first groundwater sampling event took place May 13, 1988 and identified impacts in the location of two former evaporation ponds north and east of the main plant. LNAPL was identified immediately above the water table at an approximate depth of 106 feet below ground surface. Several additional subsurface investigations took place in order to determine the extent of both the free and dissolved phase hydrocarbon plumes, requiring the installation of monitoring and recovery wells as specified below:

- MW-5 through MW-8 and RW-1: Installed May 1990; LNAPL recovery began on RW-1.
- MW-9 through MW-12: Installed October 1990.
- MW-13 and MW-14: Installed March 1991; MW-7, MW-8, and MW-10 were converted into recovery wells.
- MW-15 through MW-20: Installed February 1992.

Following installation of the final six wells, quarterly groundwater sampling commenced. BDM International, Inc. suggested initiation of additional remedial activities. A soil vapor extraction (SVE) and air sparge system operated between 1993 and 2004. Currently the Lee Gas Plant is sampled on a semi-annual basis.

3. Groundwater Monitoring

This section describes the groundwater field and laboratory activities performed during the first half semi-annual 2013 monitoring event. Monitoring activities were conducted on June 4-5, 2013 and included Site-wide groundwater gauging, LNAPL measurements, and groundwater sampling. Figure 2 illustrates the groundwater monitoring network utilized to perform these activities at the Site.

3.1 Groundwater and LNAPL Elevation Monitoring

Groundwater and LNAPL levels were measured in order to evaluate hydraulic characteristics and provide information regarding seasonal and annual fluctuations in groundwater elevations at the Site. During the first half semi-annual 2013 event, groundwater levels were measured at all nineteen Site monitoring well locations.

Groundwater levels were measured on the north side of the well casing to the nearest 0.01-foot using an oil-water interface probe (IP). Groundwater level data were later converted to elevation (feet above mean sea level [AMSL]). Measured groundwater levels and calculated groundwater elevation data are presented in Table 1 and a first half semi-annual 2013 groundwater elevation contour map is illustrated on Figure 3. The presence of LNAPL, where detected by the IP, is also presented in Table 1.

Groundwater elevations ranged from 3,869.49 feet AMSL at monitoring well MW-20 to 3,873.17 feet AMSL at monitoring well MW-16. Groundwater flow at the Site generally trends to the southwest (Figure 3) with a gradient of approximately 0.0026 foot per foot between monitoring wells MW-16 and MW-20. Groundwater elevations from the highest and lowest measured wells were not used in calculating hydraulic gradient due to the presence of LNAPL. The selected elevations were directly measured and are considered representative of the general gradient and flow direction at the site.

LNAPL was detected at the following locations, with measured thickness indicated in parenthesis:

- MW-5 (0.44-ft)
- MW-6 (0.06-ft)
- MW-8 (0.24-ft)
- MW-15 (4.43-ft)

3.2 Groundwater Quality Monitoring

Subsequent to the collection of groundwater level measurements, groundwater samples were collected from fourteen of nineteen wells. Monitoring wells with detected LNAPL (MW-5, MW-6, MW-8, and MW-15), were not sampled. Monitoring well MW-3 did not contain sufficient water to obtain a representative sample.

A minimum of three well casing volumes of groundwater were purged from each monitoring well prior to collecting groundwater samples. Groundwater samples were collected using dedicated polyethylene bailers, placed in clean laboratory supplied containers for the selected analytical methods and packed in

an ice-filled cooler and maintained at approximately four degrees Celsius (^{0}C) for transportation to the laboratory. Groundwater samples were shipped under chain-of-custody procedures to ALS Environmental (ALS) laboratory in Houston, Texas, for analysis.

Water quality samples were submitted for analysis of benzene, toluene, ethylbenzene, and xylene (BTEX) by United States Environmental Protection Agency (USEPA) Method 8260B.

Concentrations exceeding the applicable groundwater standard are summarized below.

- Benzene was detected at concentrations in excess of the New Mexico Water Quality Control Commission Standard of 0.01 milligrams per liter (mg/L) at four locations:
  - **MW-9:** 16 mg/L
  - **MW-10:** 26 mg/L
  - **MW-12:** 4.3 mg/L
  - **MW-21:** 0.78 mg/L
- LNAPL was detected at four (4) locations as indicated in Section 3.1 above.

Figure 4 shows the first half semi-annual 2013 event analytical results, in addition to results from the 2012 second half semi-annual event.

Table 2 presents first half semi-annual 2013 analytical data as well as recent historical results. Laboratory analytical reports for the event are included in Appendix A. Historical analytical results through the June 2013 event are included in Appendix B.

3.3 Data Quality Assurance / Quality Control

A trip blank, matrix spike or matrix spike duplicate (MS/MSD) and one field duplicate sample (MW-9) were collected during the sampling event. The data were reviewed for compliance with the analytical method and the associated quality assurance/quality control (QA/QC) procedures. All samples were analyzed using the correct analytical methods and within the correct holding times. Chain of custody forms were in order and properly executed and indicate that samples were received at the proper temperature with no headspace. All data were reported using the correct method number and reporting units. The trip blank was fully in control, having no detections of targets.

Duplicate sample was in compliance with QA/QC standards. MW-9 and associated duplicate sample returned results for benzene of 16 mg/l and 14 mg/l, respectively.

During sampling, a minimum of three well casing volumes of groundwater were purged from each monitoring well prior to collecting groundwater samples. Water quality parameters were recorded and used to confirm groundwater stabilization prior to sample collection. Parameter stabilization was achieved within three purge volumes. Therefore, the analytical data are considered to be representative of site conditions.

The overall QA/QC assessment of the field and laboratory data indicate that both field precision and overall data precision and accuracy are acceptable.

4. Remediation Activities

Measureable free phase hydrocarbons were detected during the reporting period in monitoring wells MW-5, MW-6, MW-8, and MW-15 as summarized in Table 2. LNAPL recovery was not conducted during the first half 2013.

An obstruction previously encountered in MW-15 caused by an infiltrating root system within the well screen/casing was cleared and the well rehabilitated using traditional redevelopment techniques. During redevelopment activities, approximately 180 gallons of clean water were added to the well for surging and purging activities. Subsequently, approximately 200 gallons of liquid were removed from the well using a Waterra Hydrolift pump and transported for disposal at the Cooper Disposal Facility in Hobbs, New Mexico. Due to the type of collection tank and transport vehicle, the volume of recovered LNAPL during redevelopment activities was unable to be determined.

DCP plans to install a Clean Earth Technologies Magnum Spill Buster (Spill Buster) pump for automated LNAPL recovery within MW-15 to address the presence of LNAPL. The Spill Buster is an automated free phase petroleum pumping system. It is specifically designed to remove LNAPL petroleum product from the water table. Its auto-seeking device allows the pump intake to automatically follow the elevation of the oil/water interface as it fluctuates in the recovery well. The unit is designed to specifically pump LNAPL material and will not pump any amount of water from the well.

The Spill Buster system will be powered by a 24 VDC deep cycle battery/solar panel system located near the recovery well. An independent secondary contained LNAPL collection tank with a high level cutoff switch will also be installed near the recovery well.

Spill Buster installation and associated start-up activities are tentatively scheduled to occur during the third quarter of 2013.

5. Conclusions

Comparison of the first half semi-annual 2013 monitoring data with historic information provides the following general observations:

- Based on historical groundwater elevations, the potentiometric surface has remained relatively stable with minor seasonal fluctuations
- Benzene concentrations in monitoring wells MW-7 and MW-14, locations which historically have exhibited elevated concentrations, remained below regulatory standards for the second consecutive quarter.
- Monitoring wells MW-9, MW-10, MW-12, and MW-21 continue to exhibit benzene concentrations in exceedence of the New Mexico Water Quality Control Commission Groundwater Standard.
- During the second half 2012, elevated benzene concentrations were observed for the first time since 2009 in MW-16, located in the northern area of the facility. However, during the first half semi-annual 2013 event, BTEX concentrations returned below regulatory standards.

6. Recommendations

Based on evaluation of Site observations and monitoring results, the following recommendations have been developed for future activities:

- Continue semi-annual groundwater monitoring at the well locations illustrated on Figure 2 to assess trends in dissolved and free phase petroleum hydrocarbons.
- Installation of a Spill Buster LNAPL recovery system at MW-15 to address free phase petroleum thicknesses in the northern area of the Site.

MW-22	6/3/2011	108.97			148.62	NM	NM	
MW-22	12/15/2011	109.38			148.62	NM	NM	
MW-22	6/7/2012	109.70			148.62	NM	NM	
MW-22	12/6/2012	109.86			148.62	NM	NM	
MW-22	6/5/2013	109.90			148.62	NM	NM	
							Average change in groundwater elevation since the previous monitoring event	-0.04

Notes:

1- Depths measured from the north edge of the well casing.

2- Total depths were collected and recorded during the first half semi-annual 2013 monitoring event (with the exception of wells that contained LNAPL).

3- Changes in groundwater elevation calculated by subtracting the measurement collected during the previous monitoring even from the measurement collected during the most recent monitoring event.

4- Data presented for well locations includes previous four sampling events, when available. Historic groundwater elevation data may be found in Appendix C.
Sample locations are shown on Figure 2 and a groundwater elevation contour map is shown on Figure 3.

5- MW-15 was not gauged during the second half semi-annual event due to an obstruction in the well at 110.76 feet below the top of casing.

amsl - feet above mean sea level.

TOC - top of casing

NM - not measured

* For wells that contained LNAPL, groundwater elevation was corrected for product thickness using the following calculation:
Groundwater elevation = (TOC Elevation - Measured Depth to Water) + (LNAPL Thickness in Well * LNAPL Density)
LNAPL density was assumed to be approximately 0.75 grams per cubic centimeter

Notes:

1.) The environmental cleanup standards for water that are applicable to the Former Lee Gas Plant site are the New Mexico Water Quality Control Commission (NMWQCC) Groundwater Standards.

2.) Data presented for all well locations includes previous four sampling events, when available. Historic groundwater elevation data may be found in Appendix C.

Bold red values indicate an exceedance of the NMWQCC groundwater standards for the Site.

Sample locations are shown on Figure 2 and analytical results are illustrated on Figure 4.

LNAPL = Light Non-Aqueous Phase Liquid

NM = Not measured.

mg/L = milligrams per liter.

Re: Lee Plant Work Order: **1306232**

Dear Christine,

ALS Environmental received 16 samples on 06-Jun-2013 08:50 AM for the analyses presented in the following report.

The analytical data provided relates directly to the samples received by ALS Environmental and for only the analyses requested. Results are expressed as "as received" unless otherwise noted.

QC sample results for this data met EPA or laboratory specifications except as noted in the Case Narrative or as noted with qualifiers in the QC batch information. Should this laboratory report need to be reproduced, it should be reproduced in full unless written approval has been obtained by ALS Environmental. Samples will be disposed in 30 days unless storage arrangements are made.

The total number of pages in this report is 31.

If you have any questions regarding this report, please feel free to call me.

Sincerely,

Electronically approved by: Luke F. Hernandez

Sonia West
Project Manager

QUALIFIERS, ACRONYMS, UNITS

Qualifier	Description
*	Value exceeds Regulatory Limit
a	Not accredited
B	Analyte detected in the associated Method Blank above the Reporting Limit
E	Value above quantitation range
H	Analyzed outside of Holding Time
J	Analyte detected below quantitation limit
M	Manually integrated, see raw data for justification
n	Not offered for accreditation
ND	Not Detected at the Reporting Limit
O	Sample amount is > 4 times amount spiked
P	Dual Column results percent difference > 40%
R	RPD above laboratory control limit
S	Spike Recovery outside laboratory control limits
U	Analyzed but not detected above the MDL

Acronym	Description
DCS	Detectability Check Study
DUP	Method Duplicate
LCS	Laboratory Control Sample
LCSD	Laboratory Control Sample Duplicate
MBLK	Method Blank
MDL	Method Detection Limit
MQL	Method Quantitation Limit
MS	Matrix Spike
MSD	Matrix Spike Duplicate
PDS	Post Digestion Spike
PQL	Practical Quantitation Limit
SD	Serial Dilution
SDL	Sample Detection Limit
TRRP	Texas Risk Reduction Program

Units Reported	Description
mg/L	Milligrams per Liter

MW-22	3/29/2010	NS	NS	NS	NS	
MW-22	9/24/2010	**0.0114**	<0.002	0.0033	<0.006	
MW-22	9/25/2010	**0.0114**	<0.00043	0.0033	<0.0017	
MW-22	6/3/2011	NS	NS	NS	NS	
MW-22	12/16/2011	<0.001	<0.002	<0.002	<0.004	
MW-22	6/7/2012	<0.005	<0.005	<0.005	<0.015	
MW-22	12/6/2012	<0.001	<0.001	<0.001	<0.003	
MW-22	6/5/2013	<0.001	<0.001	<0.001	<0.001	

Notes:

1.) The environmental cleanup standards for water that are applicable to the Former Lee Gas Plant site are the New Mexico Water Quality Control

Bold red values indicate an exceedance of the NMWQCC groundwater standards for the Site.

Sample locations are shown on Figure 2 and analytical results are illustrated on Figure 4.

LNAPL = Light Non-Aqueous Phase Liquid

NM = Not measured.

mg/L = milligrams per liter.
