Subject:
2013 Annual Groundwater Remediation Report
Jal No. 4 Plant
Lea County, New Mexico
NMOCD Abatement Plan Case # AP-101

Date:
March 31, 2014

Dear Mr. Von Gonten:

On behalf of El Paso Natural Gas Company, LLC, ARCADIS U.S., Inc., hereby submits the enclosed 2013 Annual Groundwater Remediation Report Jal No. 4 Plant Lea County, New Mexico (Report). This report details remediation efforts conducted at the site during calendar year 2013.

If you have any questions concerning the Report please call Mr. Joseph Wiley at (713) 420-3475 or myself at (432) 687-5400.

1. Introduction

ARCADIS U.S., Inc. (ARCADIS-US) has been retained by El Paso Natural Gas Company, LLC (EPNG) to compile the 2013 Annual Groundwater Remediation Report for the Jal No. 4 Plant located in Lea County, New Mexico. The remedial activities conducted at the Plant are performed under EPNG's Project Work Plan (dated February 1995). This Plan was approved by the New Mexico Oil Conservation Division (NMOCD) on April 27, 1995, with subsequent revisions approved on August 10, 1995, July 8, 1997, and July 30, 2002. Remediation activities are no longer conducted under the discharge permit GW-107R. The site is now under an abatement plan (AP-101).

The Plant property is comprised of approximately 181 acres of land located west of State Highway 18, approximately 9 miles north of Jal, New Mexico. The Plant property location and topographic features are shown on Figure 1. The Plant property occupies portions of Sections 31 and 32 of Township 23 South, Range 37 East, and Sections 5 and 6 of Township 24 South, Range 37 East in Lea County, New Mexico.

The Plant was constructed by EPNG in 1952 to treat, compress, and transport natural gas to EPNG's main transmission lines. EPNG discontinued their use of the Plant in 1987, leasing portions of the property to Christie Gas Corporation (Christie) that same year. Christie converted the facility to gas storage utilizing two cavern wells located on the eastern end of the property. EPNG eventually sold the Plant to Christie in 1991. In December 2002, Christie sold the Plant to Texas LPG Storage Company (Texas LPG). In March 2007, Texas LPG sold the plant to Western Refining, Inc. (WRI). WRI is the current owner of the Jal No. 4 Plant property.

Historically brine and wastewater at the Plant were managed in eight unlined retention ponds from 1952 to 1981. Beginning 1981, brine at the Plant was managed in 3 synthetic-lined ponds. In 1989, a leak was detected in one of the brine retention ponds and EPNG elected to close 2 of the ponds. In response to the detected leak, the NMOCD requested that EPNG perform a hydrologic study. This request led to 3 groundwater monitoring wells and a limited groundwater study at the site in May 1989. The preliminary study indicated that brine impacted groundwater was present beneath the Plant.

1.1 Program Wells and Sampling Schedule

To assess brine and hydrocarbon impacts to the shallow groundwater system in the Plant area, EPNG has installed eighteen monitoring wells, one piezometer, and three recovery wells on the Plant property and adjoining properties to the east (located hydraulically downgradient). EPNG has designated fifteen monitoring wells (ACW-1 through ACW-15) as program monitoring wells from which groundwater samples are frequently collected and submitted to an analytical laboratory for analysis (ACW-2 was replaced by ACW-2A on December 10, 1990). The locations of these wells are shown on Figure 2.

On April 14, 2003, the NMOCD approved a modification to the groundwater sampling program for the Plant. These modifications established the following sampling program:

- 1st Quarter – sample monitoring wells ACW-13, ACW-14, and ACW-15 and analyze for: benzene, toluene, ethylbenzene, and total xylenes (collectively referred to as BTEX), total dissolved solids (TDS), specific conductance, chloride, and sodium.
- 2nd Quarter – sample monitoring wells ACW-13, ACW-14, and ACW-15 and analyze for: BTEX, TDS, specific conductance, chloride, and sodium.
- 3rd Quarter – sample monitoring wells ACW-13, ACW-14, and ACW-15 and analyze for: BTEX, TDS, specific conductance, chloride, and sodium.
- 4th Quarter – sample all program and non-program (Section 1.2) wells and analyze for: BTEX, TDS, specific conductance, chloride, and sodium.

Program Monitoring Wells

Monitoring Well	Sampled Q1, Q2, Q3, and Q4	Sampled Q4 Only
ACW-1		X
ACW-2A		X
ACW-3		X
ACW-4		X
ACW-5		X
ACW-6		X
ACW-7		X
ACW-8		X
ACW-9		X
ACW-10		X
ACW-11		X
ACW-12		X
ACW-13	X	
ACW-14	X	
ACW-15	X	

Program monitoring wells ACW-3 and ACW-8 were converted to permanent groundwater recovery wells in October 2005. ACW-13, ACW-14, and ACW-15 were sampled during each 2013 quarterly event while ACW-1 through ACW-12 was only sampled during the 2013 4th quarter event.

1.2 Non-program Wells and Sampling Schedule

In addition to the program monitoring wells, EPNG also collects groundwater samples from two non-program monitoring wells (ENSR-1 and ENSR-3), one piezometer (PTP-1), one up gradient water supply well (EPNG-1), and two down gradient active water supply wells (Oxy Supply Well and Doom Supply Well). EPNG-1 is located at the northwest corner of the Plant property. The Oxy Supply Well is located in the approximate center of Section 5 of Township 24 South, Range 37 East and formerly provided potable water to Oxy's Myers Langlie Mattix Unit Water Injection Station. The Oxy Production well and EPNG-1 were not in service in 2013. The Doom Supply Well is a private water supply well that provides water to the residence of Mr. Jimmie J. Doom and is located in the approximate center of the northwest quarter of Section 8 of Township 24 South, Range 37 East. Additionally, three Recovery wells (RW-1, RW-2,

and RW-3) are located within the plant boundary. The locations of all of the wells discussed in this section are shown in Figure 2.

Non-program Wells

Well	Sampled Q1, Q2, Q3, and Q4	Sampled Q4 Only
ENSR-1		X
ENSR-3		X
EPNG-1	Out of service in 2013	X
PTP-1		X
Oxy Supply Well	Out of service in 2013	
Doom Supply Well	X	

No samples were collected from the OXY Supply Well or EPNG-1 during 2013. EPNG-1 was out of service due to an electrical malfunction outside of EPNG operational control. The OXY supply well was reported as out of service in 2012 and was not sampled. Communications with regards to the well's current status and permission for access were not returned. The Doom Supply well was sampled during each 2013 quarterly event while wells ENSR-1, ENSR-3, RW-3, and PTP-1 were sampled only during the 2013 4th quarter event.

Additionally, during 2013, nine site monitoring wells were sampled as a groundwater quality assessment and a study of the potential effectiveness of HydraSleeve™ sampling in assessing groundwater conditions at the site was instituted. A work plan assessing the potential effectiveness of utilizing non-purge technology is presented in Appendix C. This assessment will be finalized after the collection of 2014 groundwater analytical data.

1.3 Depth to Groundwater Measurements

During each quarterly sampling event and prior to disturbing the water columns within each well, the static depths to groundwater within the well casings were measured using an electronic water level indicator. In wells containing down-hole equipment (e.g. pumps) a steel line tape was utilized to collect the fluid levels. All depths to groundwater were measured relative to the surveyed top of casing (TOC) datum so that groundwater elevations could be determined. Table 1 provides a summary of the

depths to groundwater, TOC elevations, and groundwater elevations that have been compiled throughout EPNG's monitoring program.

1.4 Sampling Procedures

The groundwater samples were collected in accordance with EPA methods and quality assurance/quality control guidance. All groundwater monitoring wells were purged thoroughly prior to sample collection using temporary electric submersible pumps. Groundwater produced during purging and sampling operations was contained and discharged to the Plant's lined North Surface Impoundment.

During the 2013 sampling events, the groundwater samples collected from the Doom Supply Well were obtained at the well head from a water spigot.

The groundwater samples were placed directly into laboratory provided containers, labeled for source, requested analytical, and contents, packed on ice and placed under chain-of-custody control for transfer to the analytical laboratory. The results of the 2013 groundwater analyses are summarized in Table 2. Complete copies of the 2013 laboratory analytical reports are included in Appendix D. Appendix A provides a summary of the historical laboratory analytical data.

2. Results of Monitoring Activities

The following sections summarize the field measurements and laboratory analytical results obtained throughout the 2013 sampling program. These data have been compared with historic data to assess any trends that may be apparent. To facilitate these comparisons, 45 trend graphs have been prepared for TDS, chloride, sodium and benzene concentrations observed in the groundwater samples taken from the fifteen program monitoring wells. These graphs are presented in Appendix B.

2.1 Field Measurements

The depth to groundwater measurements (Table 1) indicate depths to groundwater across the Plant are approximately 100 feet below ground surface and static groundwater elevations exhibit little seasonal or historical variability.

Groundwater potentiometric surface maps have been prepared for each of the 2013 sampling events (Figures 3 through 6). The groundwater flow direction is to the

southeast (S46°E) and toward Monument Draw. The hydraulic gradient is approximately 0.0023 feet per foot. The groundwater flow direction and hydraulic gradient at the site have been consistent since 1997. Notable exceptions are those localized areas near the active recovery wells (when operational).

The groundwater recovery system was not operational in 2013. The groundwater level data collected from ACW-4 appears to show drawdown in this area. Historically, this has been attributed to the deeper screened interval in the well and the increased density of the groundwater due to the release of brine. This well, along with all other wells, will be resurveyed to confirm the elevation of the top of casing. This is discussed further in Section 5 Recommendations.

2.2 Inorganic Constituents

The laboratory provided inorganic parameters utilized to assess plume migration at the Plant are: TDS, chloride and sodium. The trends in concentrations over the last 10 years are summarized in the following table. Trends shown in parentheses were those evaluated by a previous consultant in 2012. It is assumed the previous consultant used complete historical data for the trend analysis; therefore, some shifts in trends may be artificial.

Inorganic Concentration Trends

Monitoring Well	Concentration Trends		
	TDS	Chloride	Sodium
ACW-1	↔ (↓)	↑ (↓)	↑ (↓)
ACW-2A	↓ (↓)	↓ (↓)	↓ (↓)
ACW-3(RW)	NS(↔)	NS (↔)	NS (↔)
ACW-4	↑ (↔)	↑ (↔)	↑ (↔)
ACW-5	↑ (↑)	↑ (↑)	↔ (↔)
ACW-6	↓ (↓)	↓ (↓)	↓ (↓)
ACW-7	↓ (↔)	↓ (↔)	↔ (↔)
ACW-8(RW)	NS(↔)	NS (↔)	NS (↔)
ACW-9	↑ (↑)	↑ (↑)	↑ (↑)
ACW-10	↑ (↑)	↑ (↑)	↑ (↔)
ACW-11	↑ (↑)	↑ (↑)	↑ (↔)
ACW-12	↑ (↑)	↑ (↑)	↑ (↔)
ACW-13	↑ (↑)	↑ (↑)	↑ (↔)
ACW-14	↑ (↔)	↑ (↔)	↑ (↔)
ACW-15	↑ (↔)	↑ (↔)	↑ (↔)

Key: ND denotes constituent not detected during the GMP, ↔ denotes no observable trend, ↓ denotes a decreasing trend, ↑ denotes an increasing trend

RW – System Recovery Well

NS – Not Sampled

(↔) (↑) (↓) – consultant observed trends in 2012

Note: Recovery wells ACW-3 and ACW-8 were not sampled in 2012 because they were not in operation during the 4th quarter sampling event and the submersible pumps installed within these wells precluded purging/sampling by other means.

In general, these trends indicate the overall levels of inorganic constituents are decreasing in three wells, increasing in ten wells, and have no observable trends, or are stable, in two wells. The wells and their overall trends for inorganic constituents can be grouped as follows:

Monitoring Wells with Decreasing Overall Inorganic Levels

ACW-2A ACW-6 ACW-7

Monitoring Well with Increasing Overall Inorganic Levels

ACW-1	ACW-4	ACW-5	ACW-9	ACW-10
ACW-11	ACW-12	ACW-13	ACW-14	ACW-15

Monitoring Wells with No Observable Trend in Overall Inorganic Levels

ACW-3 ACW-8

Figure 7 presents an isopleth of the chloride concentrations detected in groundwater during the 2013 sampling program. Within the New Mexico Administrative Code (NMAC) 20.6.2.3103 (B) the State has established Other Standards for Domestic Water Supply that includes a standard of 250 milligrams per liter (mg/L) for chloride in groundwater that contains TDS levels of 10,000 mg/L or less. As can be seen on Figure 7, the highest levels of chloride continue to be observed in the groundwater samples collected from the northeast portion of the Plant property. Recovery wells RW-1 and RW-3 are located in this area.

2.3 Organic Constituents

The laboratory provided organic constituent being utilized to assess plume migration at the Plant is benzene. The NMAC regulation 20.6.2.3103 (A) has established a Human Health Standard of 0.01 mg/L (10 micrograms per liter [$\mu\text{g}/\text{L}$]) for benzene in groundwater containing TDS levels of 10,000 mg/L or less. The trends in benzene concentrations over the last 10 years are summarized in the following table. Trends

shown in parentheses were those evaluated by a previous consultant in 2012. It is assumed the previous consultant used complete historical data for the trend analysis; therefore, some shifts in trends may be artificial.

Organic Concentration Trends

Monitor Well	Benzene Concentration Trend
ACW-1	↑ (↔)
ACW-2A	↓ (↓)
ACW-3(RW)	(NS)(↔)
ACW-4	↑ (↔)
ACW-5	↔ (↔)
ACW-6	↓ (↓)
ACW-7	↑ (↑)
ACW-8(RW)	NS(↔)
ACW-9	↑ (↔)
ACW-10	↑ (↑)
ACW-11	↓ (↔)
ACW-12	↑ (↔)
ACW-13	↔ (↔)
ACW-14	↔ (↔)
ACW-15	↔ (↔)

Key: ND denotes constituent not detected during the GMP, ↔ denotes no observable trend, ↓ denotes a decreasing trend, ↑ denotes an increasing trend

RW – System Recovery Well

NS – Not Sampled

(↔) (↑) (↓) – consultant observed trends in 2012

Note: Recovery wells ACW-3 and ACW-8 were not sampled in 2012 because they were not in operation during the 4th quarter sampling event and the submersible pumps installed within these wells precluded purging/sampling by other means.

In general, these trends indicate the overall levels of benzene are decreasing in three wells, increasing in six wells, and have no observable trend, or are stable, in four wells. The wells and their overall trends for benzene levels can be grouped as follows:

Monitoring Wells with Decreasing Overall Organic Levels

ACW-2A ACW-6 ACW-11

Monitoring Well with Increasing Overall Organic Levels

ACW -1 ACW-4 ACW-7 ACW-9 ACW-10 ACW-12

Monitoring Wells with No Observable Trend in Overall Organic Levels

ACW-3 ACW-5 ACW-8 ACW-13 ACW-14 ACW-15

Figure 8 presents an isopleth of the benzene concentrations detected in groundwater during the 2013 sampling program. Benzene was detected in seven on-site and six off-site monitoring/recovery wells. Concentrations of benzene exceeding the New Mexico Water Quality Control Commission (NMWQCC) groundwater standard for benzene of 10 µg/L were observed in the groundwater samples collected from on-site monitoring wells ACW-4 (99.1 µg/L) and ENSR-3 (30.2 µg/L), and off-site monitoring well ACW-7 (34.3 µg/L). Recovery wells RW-1 and RW-3 are located in this area for the purpose of capturing this impacted groundwater. These recovery wells are located hydraulically up-gradient of ACW-7.

3. Groundwater Remediation System

To date, EPNG has installed two groundwater recovery wells to mitigate impacts to the groundwater. These wells are identified as RW-1 and RW-2, and the locations of these wells are shown on Figure 2. Due to chronic scaling problems that occurred within recovery well RW-1, monitoring well ENSR-2 was tested as a recovery well in 2000 and operated intermittently as a replacement well for RW-1 in 2001 and 2002. ENSR-2 was permitted as a stand-alone recovery well on January 27, 2003. In February 2011, EPNG submitted an application to the New Mexico Office of the State Engineer (NMOSE) for a permit to plug and abandon groundwater recovery well ENSR-2, and drill a replacement recovery well (RW-3) because recovery well ENSR-2 was inoperable due to the submersible pump becoming stuck and irretrievable. In August 2011, the NMOSE issued EPNG a permit to plug/abandon recovery well ENSR-2 and drill/install recovery well RW-3 (Permit Number CP-37 POD13). These activities were conducted on May 16-17, 2012. RW-3 is not currently operational. RW-3 is located on Plant property near to RW-1 in an area which is considered the source location of

the brine and hydrocarbon impacts to groundwater. Recovery well RW-2 is located hydraulically downgradient to recovery wells RW-1 and RW-3, and is approximately 780 feet east of the Plant property boundary. Program monitoring wells ACW-8 and ACW-3 was pilot tested as groundwater recovery wells in April and June 2005, respectively. These two wells were permitted and configured as permanent recovery wells in October 2005.

EPNG has installed below-grade pipelines which connect all of the groundwater recovery wells to a Class II water disposal well (Shell State #13 SWD) located immediately north of the Plant in the northwest quarter (NW/4), of the southwest quarter (SW/4), of Section 32, Township 23 South, Range 37 East. This well, identified as the Shell State #13 SWD, was approved for disposal by NMOCD on October 23, 1979 and has a perforated injection interval of 3,866 to 3,982 feet below ground level. This injection well is currently owned and operated by WRI. It should be noted that in May 2012, down hole scale buildup rendered the Shell State #13 SWD injection well unusable and groundwater remediation/recovery activities were halted. The plugging was cleared by a work over in the second quarter of 2013. Investigations have been conducted on the cause of the scaling. The current line of reasoning suggests that scaling of the injection well is due to mixing of recovered groundwater from two endpoints: one has high (microbial inhibiting) TDS, elevated hydrocarbons, and high sulfate; the key feature of the other groundwater type is low to moderate TDS. The blending of the two in the piping and injection system dilutes the TDS, stimulating the production of iron sulfides and biofilm through a reaction between sulfate and hydrocarbons via sulfate reducing microorganisms. Managing the fouling issue can be performed in several ways and an analysis of these options is ongoing. Focusing on the hydrocarbons provides the most feasible options, such as activated carbon filtration, air stripping, as well as others. Also worth consideration is storing recovered groundwater in tanks to allow sulfate reactions to proceed to completion before filtration and injection.

Continuous groundwater recovery began from recovery well RW-1 in October 1999, RW-2 in January 2000, ENSR-2 in August 2000, and ACW-3 and ACW-8 in October 2005. Recovery well RW-3 was drilled/installed in May 2012 but has not been operated. Table 3 provides a summary of the volumes of groundwater pumped from each of these wells in 2012. Groundwater recoveries from recovery wells RW-1, RW-2, ENSR-2, ACW-3 and ACW-8 in calendar year 2013 totaled 0.0 gallons. This total

volume is equivalent to 0.0 acre-feet of water. EPNG is permitted by the New Mexico State Engineers Office to withdraw a total of 125 acre feet per year from the following sources:

- 35 acre feet per year from RW-1, ENSR-2, and RW-3 effective June 1997
- 35 acre feet per year from RW-2 effective June 1997
- 20 acre feet per year from ACW-3 effective October 2005
- 35 acre feet per year from ACW-8 effective October 2005

A summary of the amount of groundwater recovered from each of the wells is presented in Table 3. This table presents the total number of gallons recovered per well per year. In addition, the total amount of water recovered per year is presented in gallons and in acre-feet.

4. Conclusions

Based upon a review of the data presented herein, ARCADIS-US has developed the following conclusions:

- Groundwater in the Plant area occurs within an unconfined groundwater bearing unit with the top of saturation occurring at approximately 100 feet BGL. The base of this groundwater system occurs at approximately 170 feet BGL, resting unconformably on Triassic age sediments.
- The groundwater elevations have shown little fluctuation since EPNG's investigation began in 1989.
- Groundwater flow direction at the Plant is and has been consistently flowing from the northwest to the southeast (S46°E). The hydraulic gradient is approximately 0.0023 feet per foot. The potentiometric surface

shows an area of apparent drawdown within the area of ACW-4, but this is thought to be an error in the top of casing elevation.

- The groundwater beneath a portion of the Plant property has been impacted by chlorides, and to a lesser degree light petroleum hydrocarbons associated with historic site activities. The groundwater analytical data indicates the chloride impacted groundwater has migrated hydraulically downgradient from the Plant property. During 2013, the groundwater samples collected from seven on-site and six off-site monitoring/recovery wells contained levels of chloride that exceed the EPA's Secondary Drinking Water Standard and New Mexico's Domestic Water Supply Standard of 250 mg/L.
- The levels of chloride observed in downgradient monitoring wells ACW-13 (215 mg/L), ACW-14 (154 mg/L) and ACW-15 (170 mg/L) remain below the New Mexico's Domestic Water Supply Standard of 250 mg/L.
- Benzene concentrations detected in the groundwater collected from 3 on-site wells (ACW-4, ENSR-3 and RW-3) exceed the NMWQCC standard of 0.010 mg/L. Benzene impacted groundwater has migrated hydraulically down-gradient from the Plant onto adjacent properties. Benzene concentrations in off-site downgradient wells are below the New Mexico Domestic Water Supply Standard of 0.010 mg/L. with the exception of well ACW-07. Groundwater analytical data suggest natural attenuation mechanisms as well as active groundwater remediation have effectively mitigated further down-gradient migration of the benzene impacted groundwater.

5. Recommendations

Based upon a review of the data contained within this report, the following recommendations are made:

- Restart the groundwater recovery system including RW-3. Remediation efforts should focus on capturing the most highly impacted groundwater. Particular emphasis should be placed upon evaluating vertical variations in brine concentrations which may be present within the groundwater system.
- Due to the apparent anomalous water levels observed in the area of ACW-4, it is recommended all well top of casings be surveyed to confirm an accurate measuring point elevation.
- In an effort to determine the cause of the Shell State #13 SWD scaling, a series of groundwater samples will be collected. The analysis of this water will aid in the determination of the cause of the scale buildup and inform the decision of how to prevent it moving forward.

			12/13/13	108.30	3,196.11

Notes:

1. TOC : Measured from top of casing.
2. AMSL : Above mean sea level.
3. NM : No measurement taken.
4. BGL: Below ground level.

		11/8/2011								

1. < : Denotes a sample value of less than the laboratory reporting limit.

2. --- : No analysis performed.

3. Jm : Estimated value--possible matrix effect.

4. Jc: This concentration may be biased because the continuing calibration verification (CCV) standard did not meet QC requirements for this analyte.

ies meet method requirements and analytical results are in control.

5. * : Method blank had detectable levels of this compound.

6. 1.2<0.05 : NEL Lab result/Montgomery Watson Lab result.

7. P : Denotes sample was received with a pH greater than 2.

8. H: Sample was analyzed outside the EPA technical holding time.

9. R : Denotes a reanalyzed sample.

10. J : Indicates an estimated value.

11. PM: indicates ICP-AES method

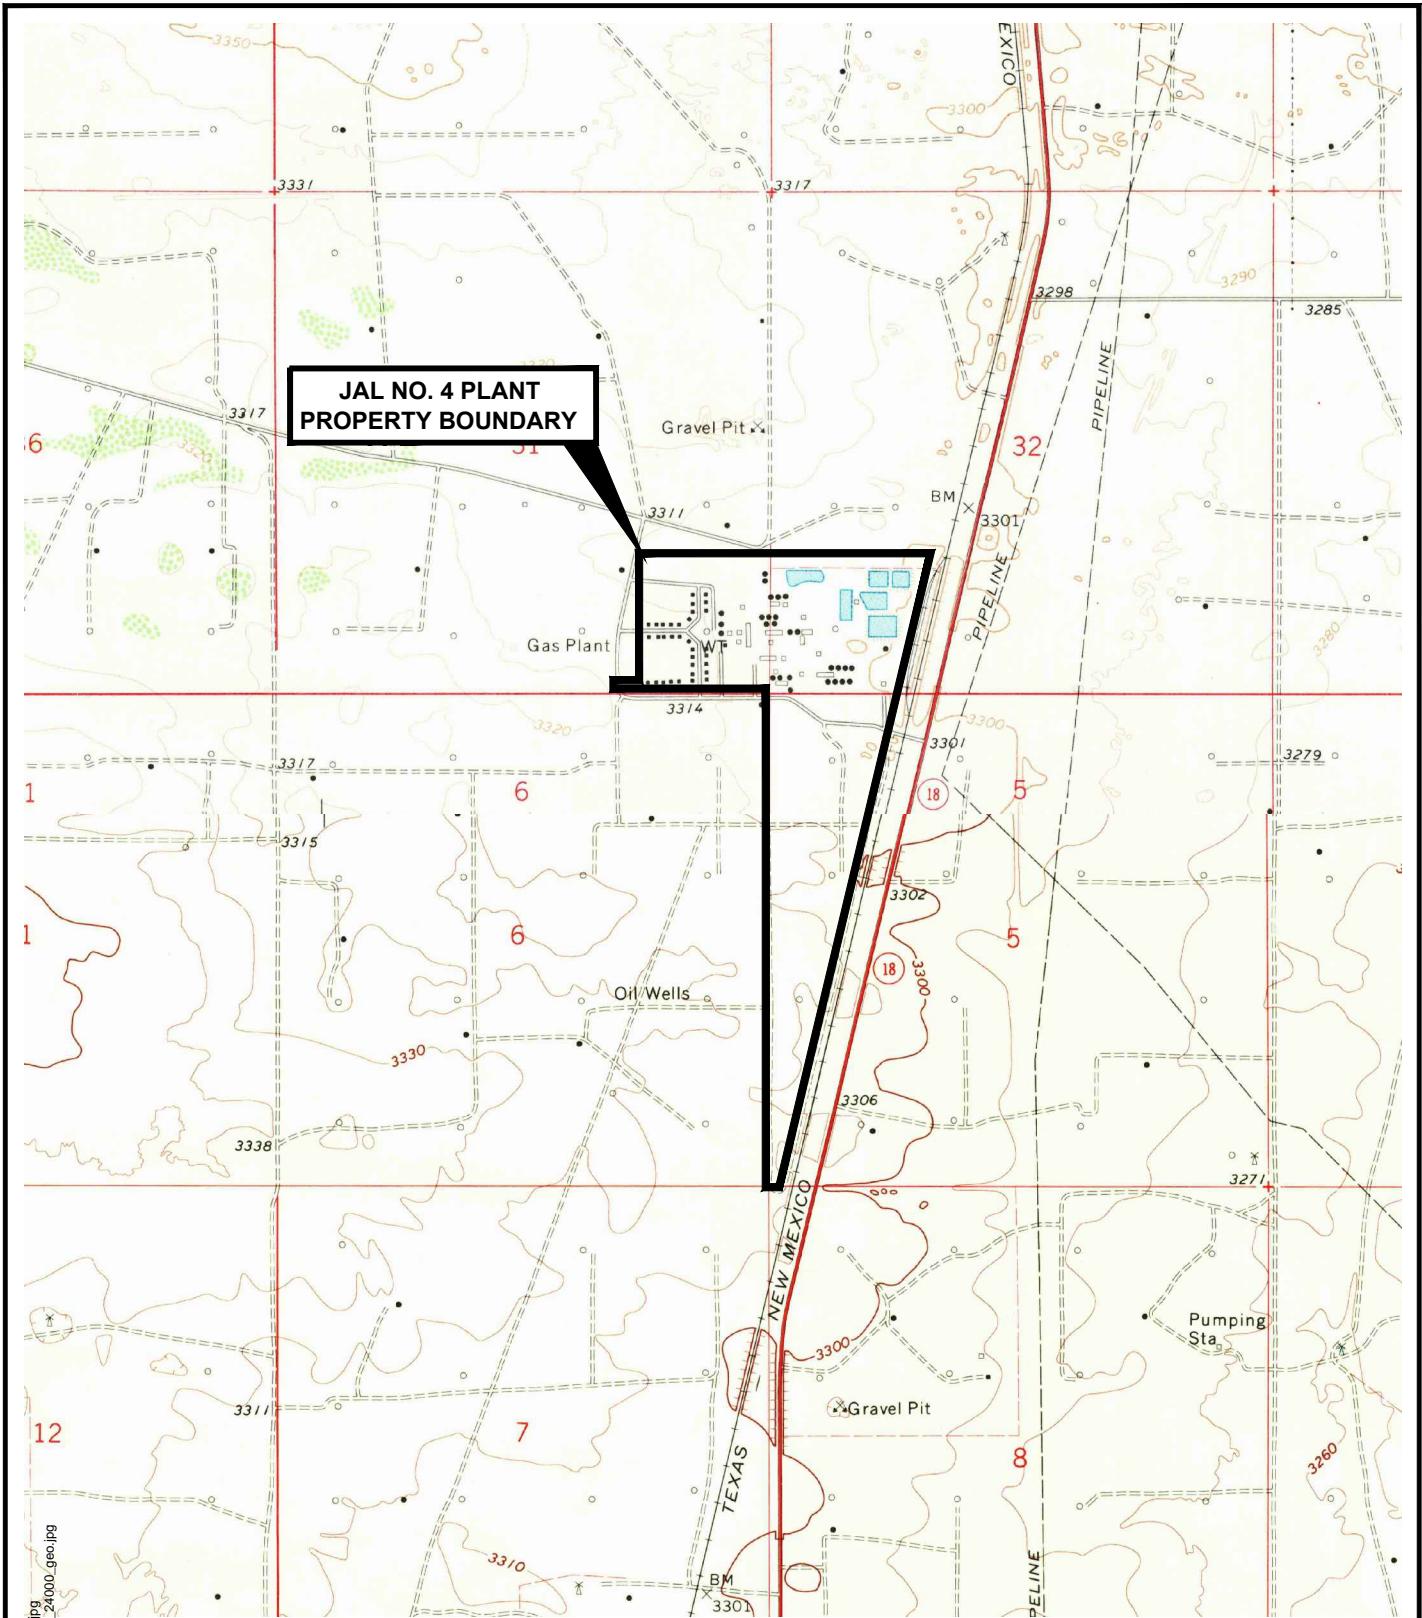

12. 1.00 (404) : Result in parenthesis is from a re-analysis conducted outside the EPA technical holding time.

13. ** : Doom Supply was resampled on 9/17/2009

NOTES

- 1) JAL #4 PLANT PROPERTY IS LOCATED WITHIN SECTIONS 31 AND 32 OF TOWNSHIP 23 SOUTH, RANGE 37 EAST, AND SECTIONS 5 AND 6 OF TOWNSHIP 24 SOUTH, RANGE 37 EAST, LEA COUNTY, NEW MEXICO.
- 2) SITE BASE AREA DIGITIZED FROM 11/04/76 AERIAL PHOTOGRAPH WITH PLANT PROPERTY BOUNDARY, WELLS INSERTED FROM VARIOUS OTHER SOURCES, AND DRAWING FILES PROVIDED BY SAIC ENERGY, ENVIRONMENT & INFRASTRUCTURE, LLC OF TULSA, OKLAHOMA.
- 3) RECOVERY SYSTEM WAS NOT OPERATED IN 2013.

LEGEND

NOTES

- 1) CHLORIDE CONCENTRATIONS SHOWN ARE THE HIGHEST LEVELS DETECTED IN GROUNDWATER IN EACH WELL DURING THE 2013 MONITORING PROGRAM.
- 2) EPA's SECONDARY DRINKING WATER STANDARD (SMCL) FOR CHLORIDE IN PUBLIC WATER SUPPLY SYSTEMS IS 250 mg/L.
- 3) NEW MEXICO ENVIRONMENTAL DIVISION HAS ESTABLISHED OTHER STANDARDS FOR DOMESTIC WATER SUPPLY OF 250 mg/L FOR CHLORIDE IN GROUNDWATER CONTAINING TDS LEVELS OF 10,000 mg/L OR LESS.
- 4) JAL #4 PLANT PROPERTY IS LOCATED WITHIN SECTIONS 31 AND 32 OF TOWNSHIP 23 SOUTH, RANGE 37 EAST, AND SECTIONS 5 AND 6 OF TOWNSHIP 24 SOUTH, RANGE 37 EAST, LEA COUNTY, NEW MEXICO.
- 5) SITE BASE AREA DIGITIZED FROM 11/04/76 AERIAL PHOTOGRAPH WITH PLANT PROPERTY BOUNDARY AND WELLS INSERTED FROM VARIOUS OTHER SOURCES.

ARCADIS HydraSleeve™ Sampling SOP version 2c

1. Introduction

The goal of the full No Purge Assessment is to evaluate whether no purge sampling techniques can be used as an alternative to standard three casing volume purge (standard purge) sampling to demonstrate compliance with groundwater quality standards; and if so, under what conditions. The comparison of standard purge and no purge sampling is based upon the following criteria:

- Historical standard purge sampling data exists for comparison
- Standard Purge field parameters have been confirmed to meet stabilization prior to sampling and are representative of the groundwater formation.
- Constituents of Concern (CoCs) include benzene, toluene, ethylbenzene, and total xylenes (collectively referred to as BTEX), total dissolved solids (TDS), specific conductance, chloride, and sodium
- Site monitoring wells are placed in permeable aquifer materials that are appropriate for standard purge and no purge sampling.

Standard purge and no purge are both viable groundwater sampling methodologies (ITRC, 2006, 2007; Parker and Clark, 2002; Parsons, 2005; Puls and Barcelona, 1996), as both are based on the principle that groundwater is continuously flushing the open interval of a monitoring well. The pilot study program assumes that the results of standard purge sampling are the standard for comparison. For this study, the HydraSleeve™ sampling method was chosen as the no purge technique due to its simplicity of use, repeatability, compatibility with a range of CoCs, and cost advantages. A key technical advantage to HydraSleeve™ samplers is that they can be deployed to collect samples from target depths more precisely than bailers while causing less agitation, and lack the equilibration time and analyte limitations associated with permeable diffusion bags (PDBs). In addition, a new HydraSleeve™ may be deployed after sampling and left in place in a target well between sampling events, thereby reducing field time following the initial deployment. Refer to Appendix A for a Standard Operating Procedure for the use of HydraSleeve™ and bibliography of studies conducted using No Purge sampling methods are included in the following References section.

To assess brine and hydrocarbon impacts to the groundwater in the Plant area, EPNG has installed eighteen monitoring wells, one piezometer, and three recovery wells on the Plant property and adjoining properties to the east (located hydraulically downgradient). EPNG has designated fifteen monitoring wells (ACW-1 through ACW-15) as program monitoring wells from which groundwater samples are frequently collected and submitted to an analytical laboratory for analysis (ACW-2 was replaced by ACW-2A on December 10, 1990). The locations of these wells are shown on Figures 2 of the 2013 Annual Groundwater Remediation Report.

The following outlines groundwater sampling of the Program wells for the Plant.

- 1st Quarter – sample monitoring wells ACW-13, ACW-14, and ACW-15 and analyze for: benzene, toluene, ethylbenzene, and total xylenes (collectively referred to as BTEX), total dissolved solids (TDS), specific conductance, chloride, and sodium.
- 2nd Quarter – sample monitoring wells ACW-13, ACW-14, and ACW-15 and analyze for: BTEX, TDS, specific conductance, chloride, and sodium.
- 3rd Quarter – sample monitoring wells ACW-13, ACW-14, and ACW-15 and analyze for: BTEX, TDS, specific conductance, chloride, and sodium.
- 4th Quarter – sample all program and non-program (Section 1.2) wells and analyze for: BTEX, TDS, specific conductance, chloride, and sodium.

Program Monitoring Wells

Monitoring Well	Sampled Q1, Q2, Q3, and Q4	Sampled Q4 Only
ACW-1		X

ACW-14	X
ACW-15	X

Program monitoring wells ACW-3 and ACW-8 were converted to permanent groundwater recovery wells in October 2005. Because of the downhole equipment, these wells will not be sampled in this program. In addition to the program monitoring wells, EPNG also collects groundwater samples from two non-program monitoring wells (ENSR-1 and ENSR-3), one piezometer (PTP-1), one up gradient water supply well (EPNG-1), and two down gradient active water supply wells (Oxy Supply Well and Doom Supply Well). EPNG-1 is located at the northwest corner of the Plant property. The Oxy Supply Well is located in the approximate center of Section 5 of Township 24 South, Range 37 East and formerly provided potable water to Oxy's Myers Langlie Mattix Unit Water Injection Station. The Oxy Production well and EPNG-1 were not in service in 2013. The Doom Supply Well is a private water supply well that provides water to the residence of Mr. Jimmie J. Doom and is located in the approximate center of the northwest quarter of Section 8 of Township 24 South, Range 37 East. Additionally, 3 Recovery wells (RW-1, RW-2, and RW-3) are located within the plant boundary. Only the Non-Program Wells ENSR-1, ENSR-3 and PTP-1 will be included in this study as all other wells have downhole equipment preventing the installation of the HydraSleeve™.

Non-program Wells

Well	Sampled Q1, Q2, Q3. and Q4	Sampled Q4 Only
ENSR-1		X
ENSR-3		X

PTP-1		X
Oxv Supply Well	Out of service in 2013	
Doom Supply Well	X	

Only the Non-Program Wells ENSR-1, ENSR-3 and PTP-1 will be included in this study as all other wells have downhole equipment preventing the installation of the HydraSleeve™.

2. Methodology

2.1 Sampling

The current monitoring program at the Jal No. 4 site utilizes standard purge sampling for determination of concentrations of chemicals of concern in the groundwater bearing unit. No purge sampling was initiated in the third quarter of 2013 and was conducted according to the ARCADIS HydraSleeve™ (Sleeves) Sampling SOP version 2c (Attachment 1). In order to ensure that stabilization of the well was achieved, Sleeves were installed a minimum of two weeks prior to each sampling event to allow the wells to equilibrate before sample collection. During each sampling event, groundwater levels in each program and non-program well will be recorded. HydraSleeve™ samples will then be collected. Once the no purge samples are collected from each well, the purge samples will be collected per the current work plan. Tables 1 and 2 provide summaries of preliminary no pure and purge laboratory results. The laboratory reports can be found in Appendix A of the 2013 Annual Remediation Report.

2.2 Evaluating the Data

For the purpose of determining if the standard purge samples and no purge samples are comparable and that the no purge samples are representative of the groundwater concentrations of COC's an analysis of the data will be performed. The collection of this data is in the preliminary stages and a sufficient population of data has not yet been collected to make a determination.

Evaluation of relative percent difference (RPD) between paired standard purge and no purge results will be used to classify individual wells with regards to no purge performance. An RPD of 150% will be used as a cutoff for screening potentially erroneous results (i.e., outliers).

Paired t-tests will be conducted across the site for each analyte to evaluate bias in the two sampling methods (i.e., standard purge result greater than no purge result).

Logistic regression models will be built to evaluate the reliability of using measured no purge concentrations to predict whether concentrations obtained using standard purge would exceed regulatory limits.

Groundwater Sampling with HydraSleeves™ – Standard Operating Procedure

Rev. #: 2

Rev Date: February 2011

Approval Signatures

Prepared by: 
Erika L.W. Carter, Ph.D.

Date: 2/2/11

Reviewed by: 
Craig Divine, Ph.D., P.G. (Technical Expert)

Date: 2/2/11

I. Scope and Application

This Standard Operating Procedure (SOP) establishes guidelines and procedures for use by field personnel in the deployment of HydraSleeves™ and subsequent collection and documentation of groundwater samples for chemical analysis. Proper collection procedures are necessary to assure the quality and integrity of all groundwater samples. The details within this SOP should be used in conjunction with site-specific work plans.

The HydraSleeve™ groundwater sampler can be used to collect a representative sample for most physical and chemical parameters without purging the well. It collects a groundwater sample from a user-defined interval (typically within the well screen), without mixing fluid from other intervals. The HydraSleeve™ is placed within the screened interval of the monitoring well, and a period of time is allocated for the well to re-equilibrate following HydraSleeve™ down-hole deployment. The sealed HydraSleeve™ can be activated and removed for sample collection within several hours to several months. When activated, the HydraSleeve™ collects a sample with no drawdown and minimal agitation or displacement of the water column. Once the sampler is full, the one-way reed valve collapses, preventing mixing of extraneous, non-representative fluid during HydraSleeve™ recovery from the well.

Use of this SOP will provide samples for Level III and Level IV analytical data for use in risk assessments, site characterizations, evaluation of remediation alternatives, engineering design of remediation activities, and in support during remediation activities.

II. Personnel Qualifications

All personnel shall meet the requirements of the site-specific Health and Safety Plan (HASP).

The Project Manager is responsible for ensuring that all sample collection activities are conducted in accordance with this SOP and any other appropriate procedures. This will be accomplished through staff training and by maintaining quality assurance/quality control (QA/QC).

The Field Manager is responsible for periodic observation of field activities and review of field generated documentation associated with this SOP. The Field Manager is also responsible for implementation of corrective action (e.g., retraining personnel, additional review of work plans and SOPs, variances to QC sampling requirements, issuing non-conformances, etc.) if problems occur.

Field personnel assigned to collect groundwater samples are responsible for completing their tasks according to specifications outlined in this SOP and other appropriate procedures. Field staff shall have prior experience in groundwater sampling. The determination of placement of the HydraSleeve™ in the monitoring well shall be made by a qualified geoscientist. All staff are responsible for reporting deviations from procedures in the Field Activity Daily Log, and to the Field Manager or Project Manager.

III. Equipment List

There are three main steps for collecting groundwater samples with HydraSleeves™: 1) assembly and deployment of the HydraSleeve™, 2) collecting the groundwater samples after the equilibration period, 3) and pouring the groundwater samples into containers. The equipment needed for each step is listed below.

Equipment needed for assembly and deployment of the HydraSleeves™:

- Appropriate personal protective equipment (PPE)
- Well location maps and table identifying HydraSleeve™ deployment locations/depths
- Well keys
- Flame ionization detector (FID) (as appropriate)
- Photoionization detector (PID) (as appropriate)
- Electronic water-level indicator, 0.01 ft accuracy
- Oil/water interface probe (as appropriate)
- Plastic sheeting to protect all down-hole sampling equipment from contact with potential sources of contamination.
- Decontamination equipment
- Appropriate size HydraSleeves™ for the wells being sampled. Some examples are provided below. Check the manufacturer's website for additional options:
 - 2-L 2" HydraSleeve™ SuperSleeve (SS) (1.9" OD, 60" long; volume of 2 liters; requires special 2-piece top weight) for 2" Schedule 40 wells

- 1-L 2" HydraSleeve™ (1.75" OD, 36" long; volume of 1 liter) for 2" wells
- 1.5" HydraSleeve™ (1.5" OD, 30" long; volume of 625 mL) for 1.5" wells
- 1" HydraSleeve™ (1" OD, 48" long; volume of 325 mL) for wells less than 1.5"
- 1/8-inch diameter braided polypropylene rope (for tethers)
- Weights (stainless steel or other inert material) to anchor HydraSleeves™ in wells (note special weights are required for SuperSleeve-style HydraSleeves™)
- Cable ties to anchor HydraSleeves™ to tether
- Measuring tape
- Cutting implement, such as scissor or knife
- Approved site-specific workplan, Field Sampling Plan (FSP), and HASP

Equipment needed for collection/dispensing of groundwater samples:

- Appropriate PPE
- Planned Sample Table (PST), sample labels, and Chain of Custody forms (COC)
- Sample bottles, coolers, ice
- Blank collection field forms
- Well keys, site maps, and sample list
- Electronic water-level indicator, 0.01 ft accuracy
- Oil/Water interface probe (as appropriate)
- Decontamination equipment

- Plastic sheeting to protect all down-hole sampling equipment from contact with potential sources of contamination.
- Bucket or other container to hold extra groundwater
- Additional HydraSleeves™ and zip ties to deploy for the next sampling event, as appropriate
- Approved site-specific workplan, FSP, and HASP

Unless otherwise specified in the site-specific workplan, it is advisable to establish a sampling order starting with the least contaminated well and progressing to the most contaminated last.

IV. Cautions

Selection of the appropriate size HydraSleeve™ depends on sample volume requirements, well diameter, and the length of the saturated screened interval (which dictates the maximum distance allowed over which to pull and fill the HydraSleeve™). The largest HydraSleeve™ (60-inch) holds 2 liters of sample; the smallest holds 325 mL of sample. The sample volume requirements must be verified with the laboratory before deploying the HydraSleeve™ samplers. The HydraSleeve™ sampler is designed for single use (deployment and sample collection) only; tethers and weights should be reused after proper decontamination.

According to the manufacturer, HydraSleeve™ has been used successfully with no equilibration period at some sites for some analytical parameters. HydraSleeve™ does not require dissolved compounds to diffuse across a membrane as in the case of polyethylene diffusion bag (PDB) samplers (ITRC, 2004). Because the HydraSleeve™ mechanically obtains a “core” of the water column, rather than relying on diffusion through a membrane, the HydraSleeve™ sampler can be retrieved shortly after deployment in many cases. One way to conservatively estimate the maximum required equilibration period is to estimate the flush-out period for the well based on the Darcy velocity within the formation (hydraulic conductivity times gradient) (Attachment B). It should be noted, however, that representative groundwater sampling may occur with a shorter flushing period, or no flushing period, if the well contains minimal accumulated silt and care is taken to minimize well disturbance during HydraSleeve™ deployment. Site-specific testing versus another accepted groundwater sampling method can be performed at a subset of wells – preferably spanning a range of hydraulic conductivity, geologic materials, and chemical concentrations – to verify that the HydraSleeve™ device produces samples similar to those obtained from the other accepted method.

V. Health and Safety Considerations

The HASP will be followed at all times. Appropriate personal protective equipment (PPE) will be worn at all times. Other safety considerations include exposure to contaminated groundwater or non aqueous phase liquid (NAPL) and using sharp cutting tools (scissors, knife).

VI. Procedure

Field personnel will perform deployment of the HydraSleeves™ in accordance with the following procedures.

Preliminary Site Activities

1. Visually inspect the well to ensure that it is undamaged, properly labeled and secured. Damage or other conditions that may affect the integrity of the well will be recorded on the Field Activity Daily Log and brought to the attention of the Field Manager or Project Manager.
2. Equipment will either be new or decontaminated in accordance with SOPs prior to use.
3. Lay out plastic sheeting and set up monitoring and sampling equipment.
4. Don appropriate PPE.
5. If specified in the site-specific workplan, measure volatile organic compounds (VOCs) at the rim of the unopened well with a PID and FID and record the reading in the field logbook.
6. Observe if any air is flowing into or out of the casing (e.g., bubbles, hissing sounds). In the event such conditions are observed, they should be noted on the HydraSleeve™ Field Form (Attachment A).
7. Remove well cap.
8. If specified in the site-specific workplan, measure VOCs at the rim of the well with a PID and FID instrument record the reading in the field logbook.
9. If the well casing does not have a reference point (usually a V-cut or indelible mark in the well casing), make one. Record all measurements from this mark.

10. If specified in the site-specific workplan, determine if non-aqueous phase liquid (NAPL) is present in the well using an oil/water interface probe in accordance with SOPs. If NAPL is present, record the depth to NAPL and static water level on the HydraSleeve™ Field Form. A HydraSleeve™ will not be deployed nor will samples be collected from wells where NAPL is present. If NAPL is not present, measure the static water level followed by the total depth of the well with an electronic interface probe, and record the measurements on the HydraSleeve™ Field Form.
11. Measure and record the depth to water and the total depth of the groundwater monitoring well (to 0.01 ft) in all wells to be sampled. Care should be taken to minimize disturbance to the water column and to any particulates attached to the sides or at the bottom of the well.
12. Determine the total depth of the well. Compare the measurement of the total depth of the well with the previous measurement and check against the well construction logs to determine the percent of screen occluded by sediment (if any). If more than 20 percent of a well screen is occluded by sediment, the well will not be sampled until it is re-developed.

Assembly and Deployment of Standard HydraSleeves™

1. Begin assembling the HydraSleeve™ by removing the HydraSleeve™ from the package and grasp top to “pop” open (Figure 1). Squeeze side fins together at top to bend reinforcing strips outward (Figure 2). Attach rope to hole at top of HydraSleeve™ (using cable ties) (Figure 3). Fold the two holes at bottom of HydraSleeve™ together and attach weight (using zip tie) (Figure 4). Sampler is ready to insert into the well at the predetermined depth specified in the site-specific workplan (Figure 5).

Figure 1

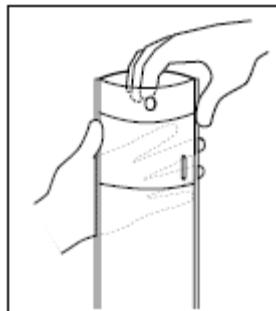

Figure 2

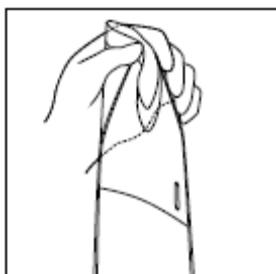

Figure 3

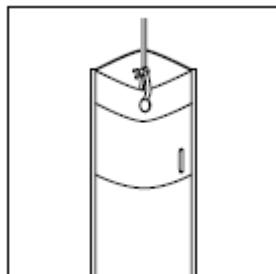

Figure 4

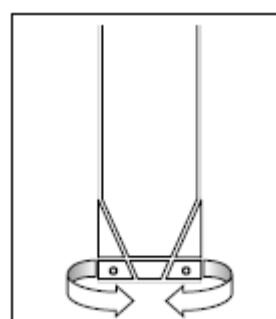

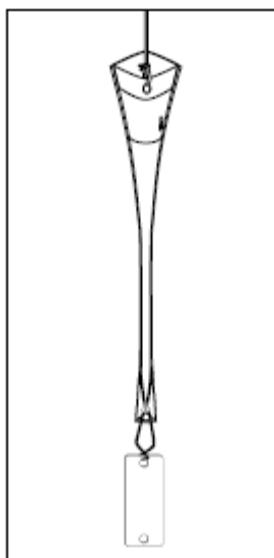

Figure 5

2. Two methods of deployment can be used. Either way, the top of the HydraSleeve™ will be positioned below the midpoint of the saturated screened interval by a distance approximately equal to 0.75 times the full length of the HydraSleeve™. For example, a 36" HydraSleeve™ will be lowered so that the top of the HydraSleeve™ is approximately 27" below the midpoint of the saturated screened interval. This position is appropriate to collect the groundwater sample from approximately the middle of the saturated screened interval when the HydraSleeve™ is pulled upward.
 - a. Bottom Anchor Deployment (preferred). Using the determined well depth, calculate the distance from the bottom of the well to the desired sampling depth (specified on the HydraSleeve™ Field Form). Attach an appropriate length anchor line between the weight and the bottom of the sampler and *slowly* lower the assembly until the weight rests on the bottom of the well, allowing the top of the sampler to float at the correct sampling depth. Attach the suspension line to the well cap to suspend the HydraSleeve™ at the correct depth until activated for sampling. Allow sufficient extra tether length such that if the tether becomes untied from the well cap and the sampler sinks to the bottom it may still be easily retrieved.
 - b. Top-Down Deployment. Measure the correct amount of suspension line needed to "hang" the top of the

HydraSleeve™(s) at the desired sampling depth (specified on the HydraSleeve™ Field Form). Once constructed, slowly lower the assembly in the well and attach the suspension line to the well cap to suspend the HydraSleeve™ at the correct depth until activated for sampling. Allow sufficient extra tether length such that if the tether becomes untied from the well cap and the sampler sinks to the bottom it may still be easily retrieved.

3. For wells in which another passive sampling device (e.g., passive diffusion bag [PDB]) is to be used concurrently, the HydraSleeve™ should be suspended from the same line directly beneath the other passive sampler. If the top-down deployment method is used, care should be taken to ensure the weight is not resting on the bottom of the well. If necessary, the weight may be placed at the top of the HydraSleeve™, as described below.

4. For wells with screen lengths less than 10 feet (specified on the HydraSleeve™ Field Form) or where the saturated screen length is less than 10 feet (determined during water level gauging), top-down deployment will be used as described above with the exception of the placement of the weight. The weight for these wells will be placed on the top of the HydraSleeve™ as shown in the figure below (Photo 1). The hanging clip is inserted locking the top of the HydraSleeve™ and the weight together. The tether will be attached to the apex of the clip, as shown below (Photo 2).

Photo 1

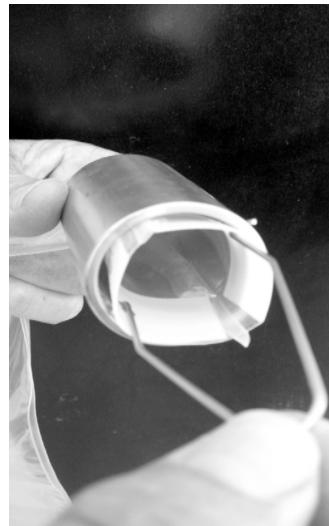

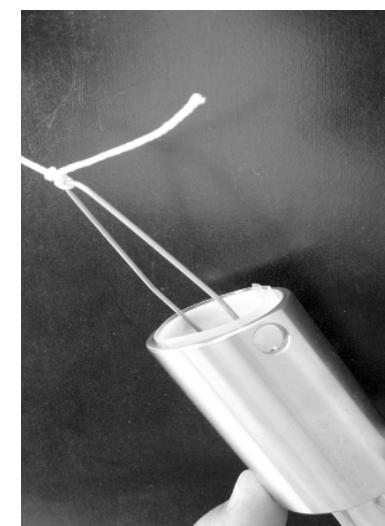

Photo 2

5. At this point deployment is complete. The well must be allowed time for the stabilization of well water and formation water following any disturbance caused by the sampler deployment before groundwater samples can be collected. The manufacturer's recommended deployment time is hours to months. The time shall be specified in the site-specific workplan. The maximum deployment time at the site will be one year.
6. After the equilibration period is complete; the groundwater samples are ready to be collected for analysis.

Assembly and Deployment of SuperSleeve-style HydraSleeve™ SS

1. Begin assembling the HydraSleeve™ by removing the HydraSleeve™ SS from the package and attaching the bottom weight (Photos 3 and 4). Fold the two holes at bottom of HydraSleeve™ together. Open prongs of bottom weight clip by squeezing. Insert reusable weight clip through holes and attach the bottom weight.

Photo 3

Photo 4

2. Attach the top weight as follows: Insert the open (check valve) end of the HydraSleeve™ SS through the bottom of the stainless steel portion of top weight until about 1/2 inch of the open sleeve protrudes above the female threads. Thread stainless steel weight (female thread) onto PVC top piece (male thread) locking the top of the HydraSleeve SS between the threads (Photo 5).

Photo 5

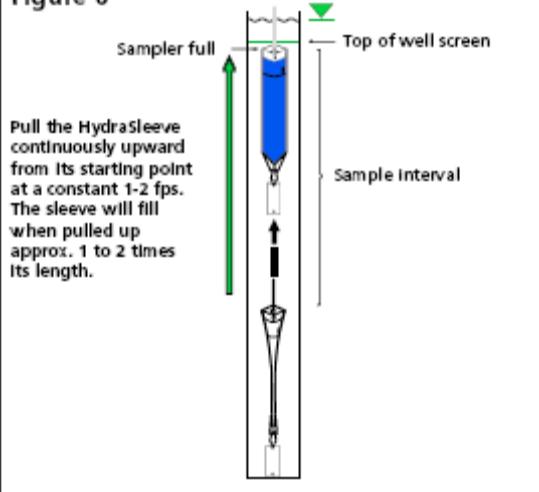

3. Attach rope to top weight (using cable ties).
4. Sampler is ready to insert into the well (Photo 6). Lower the HydraSleeve SS into the well until the bottom weight touches the bottom. Provide enough slack to allow the top weight to fully compress the sampler into the bottom of the well. For example, the 2-liter HydraSleeve™ SS (5-feet long) will compress to within 2 feet of bottom of a 2-inch well screen in about 4 hours. The 2-liter HydraSleeve™ SS requires about 5 feet of water over the top of the sampler to completely fill; thus it should not be used in wells with shorter than a 10-ft saturated screen length.

Photo 6

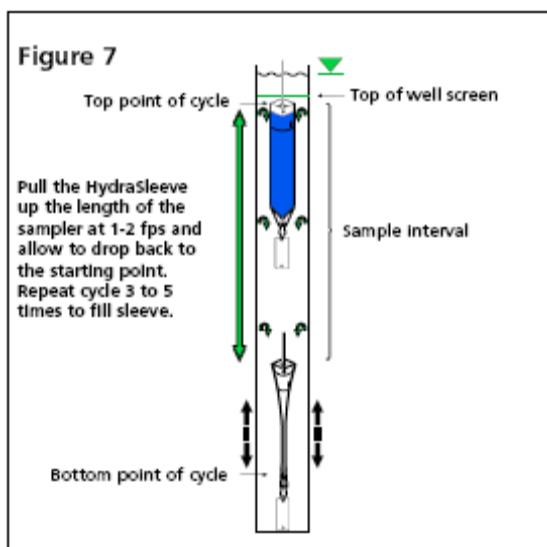

Collecting Groundwater Samples from HydraSleeves™

1. Conduct the Preliminary Site Activities detailed above with the following exception: The depth to groundwater should be collected prior to retrieval of the HydraSleeve™, while the total well depth should be collected only after the HydraSleeve™ has been retrieved from the well.
2. The Continuous Pull method is preferred and will be used for the majority of the wells. If the well to be sampled has a saturated screen length less than 10 feet in length, the Short Strokes method may be used. However, to minimize disturbance of well sediments, a preferable alternative is to use a top-weighted HydraSleeve deployment method (standard style HydraSleeve™ or SuperSleeve). The HydraSleeve™ Field Form will state the screen length and sample collection method for each well.
 - a. Continuous Pull method – The HydraSleeve™ must move upward at an approximate rate of one foot per second or faster (about the speed a bailer is usually pulled upward) for water to pass through the check valve into the sample sleeve. The total upward distance the check valve must travel to fill the sample sleeve is about 1 to 2 times the length of the sampler. For example, a 36-inch HydraSleeve™ needs a total upward movement of 36 to no more than 72 inches to fill. Pull the HydraSleeve™ continuously upward from its starting point at a constant 1 to 2 feet per second until full. This method usually provides the least turbid samples and is analogous to coring the water column from the bottom up (Figure 6).

Figure 6

- b. Short Strokes method – Pull the sampler upward at about 1 to 2 feet per second for the length of the sampler (36 inches) and let it drop back to the starting point. Repeat the cycle 3 to 5 times (Figure 7).
3. If the HydraSleeve™ is retrieved from the well and is not completely full, the sample will not be collected and a new HydraSleeve™ will be deployed. The replacement HydraSleeve™ will be allowed to equilibrate, as appropriate, prior to retrieval. After the equilibration time, the HydraSleeve™ may be collected again.

4. Collect sample parameters in the following order: VOCs (care should be taken to avoid agitation and volatilization of sample during the decanting process), explosives, metals, and other parameters. Samples will be collected and labeled in accordance with SOPs. Types of sample bottles and volume requirements for each analysis are provided in the Quality Assurance Project Plan (QAPP) and site-specific workplan. Metals samples will not be field filtered unless otherwise specified. If field filtering is required for any analyte, sample groundwater to be filtered will be decanted into an unpreserved bottle and filtered using a small hand pump as shown below in Photo 7.

5. The 36-inch long HydraSleeve™ has a capacity of 1 liter, and the largest (60-inch long) HydraSleeve™ SS for a 2-inch diameter well has a capacity of 2 liters. All groundwater samples, including QA/QC samples for a given well will be collected with one HydraSleeve™. If the volume requirement for sample analysis exceeds the capacity of the HydraSleeve™, it is not acceptable to redeploy the same or a second HydraSleeve to fill additional bottles. Rather, sampling of the well must be completely repeated. A larger size HydraSleeve™ must be deployed for the appropriate duration of time, or another approved sampling method (e.g., low-flow) must be used. Complete sample documentation on the Groundwater Sample Log.
6. Inspect the sampling bottles (obtained from the analytical laboratory prior to the sampling event) to be used to ensure that they are appropriate for the samples being collected, are undamaged, and have had the appropriate types and volumes of preservatives added. The types of sample containers to be used and sample preservation requirements will be provided in the site-specific workplan.

Photo 7

7. To remove a sample from the HydraSleeve™ with the least amount of aeration and agitation use the short plastic discharge tube (included). First, squeeze the full sampler just below the top to expel water resting above the flexible check valve (Photo 8).

Photo 8

8. Then, push the pointed discharge tube through the outer polyethylene sleeve about 3-4 inches below the white reinforcing strips (Photo 9).

Photo 9

9. Discharge the sample into the desired container in the order described in step 4 (Photo 10). Raising and lowering the bottom of the sampler or pinching the sample sleeve just below the discharge tube will control the flow of the sample. The sample sleeve can also be squeezed, forcing fluid up through the discharge tube, similar to squeezing a tube of toothpaste.

Photo 10

10. To obtain a duplicate/blind duplicate sample, collect a duplicate from the same bag as an original sample and send for analysis with the appropriate labeling.
11. To obtain an equipment blank, pour deionized water into a HydraSleeve and collect the blank using the same method as the samples and send for analysis with the appropriate labeling.
12. Place collected samples immediately in a sample cooler that is already full of ice or ice packs such that the samples are immediately chilled and stored at a temperature of 4 degrees Celsius, in accordance with SOPs.
13. Record depth to groundwater and total well depth.
14. Field parameters will be collected mid-screen from wells specified in the site-specific workplan. Calibrate all field analytical test equipment (e.g., pH, temperature, conductivity, ORP, turbidity, and DO) according to the instrument manufacturer's specifications and SOPs. Daily calibration results will be recorded on the appropriate form(s) as specified by the FSP and site-specific workplans. Instruments that cannot be calibrated according to the manufacturer's specifications will be removed from service and tagged.
15. Field parameter measurements (temperature, specific conductance, pH, DO, and ORP) will be taken after the HydraSleeve™ is removed from the well and the groundwater samples collected. This would occur through the use of a down-hole multi-meter (e.g., a YSI 600XL). Gently lower the probe of the meter down the well until it reaches the middle of the screen (screen intervals are found on the HydraSleeve™ Field Form). Follow the manufacturer's guidelines on how to determine

stability of parameter readings. Once the meter readings have stabilized, record them on the HydraSleeve™ Field Form. Turbidity will be measured from groundwater taken directly from the HydraSleeve™, after analytical samples have been dispensed.

16. After the groundwater samples and field measurements have been collected, it may be necessary to deploy another HydraSleeve™ in the well for future sampling events (e.g., quarterly, semi-annually, etc.). The site-specific workplan will state if another HydraSleeve™ is to be deployed. The same suspension line will be reused for additional deployment to ensure consistency in the deployment depth. Follow the steps outlined previously in this SOP for deployment instructions.
17. Secure the well.
18. Properly dispose of PPE and disposable equipment.
19. Decontaminate any cutting devices, reusable weights, suspension lines, or sampler attachment mechanisms after each usage in accordance with SOPs.

VII. Waste Management

Any unused water from the PDB sampler and water used to decontaminate cutting devices should be disposed following SOPs and in accordance with local, State, and Federal regulations.

VIII. Data Recording and Management

All data will be recorded on HydraSleeve™ field forms and groundwater sampling field forms. Daily field logs will be maintained. Records generated as a result of this SOP will be controlled and maintained in the project record files in accordance with project requirements.

IX. Quality Assurance

Quality assurance procedures shall be conducted in accordance with the site-specific QAPP.

SAMPLE DELIVERY GROUP CASE NARRATIVE

Client: El Paso Corporation

Job No TC26485

Site: EL Paso Natural Gas Jal #4

Report Date 3/15/2013 4:05:15 PM

11 Samples were collected between 03/01/2013 and 03/05/2013 and received intact at Accutest on 03/06/2013 and properly preserved in 1 cooler at 1.7 Deg C. These Samples received an Accutest job number of TC26485. A listing of the Laboratory Sample ID, Client Sample ID and dates of collection are presented in the Results Summary Section of this report.

Except as noted below, all method specified calibrations and quality control performance criteria were met for this job. For more information, please refer to QC summary pages.

Volatiles by GCMS By Method SW846 8260B

Matrix AQ

Batch ID: VC1369

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26485-1MS, TC26485-1MSD were used as the QC samples indicated.

Matrix AQ

Batch ID: VX1801

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26583-2MS, TC26583-2MSD were used as the QC samples indicated.

Metals By Method EPA 200.7

Matrix AQ

Batch ID: MP20043

- All samples were digested within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26485-7MS, TC26485-7MSD, TC26485-7SDL were used as the QC samples for metals.

Wet Chemistry By Method EPA 120.1

Matrix AQ

Batch ID: GN48941

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26485-1DUP were used as the QC samples for Specific Conductivity.

Wet Chemistry By Method EPA 300/SW846 9056

Matrix AQ**Batch ID:** GP22947

- All samples were prepared within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26465-1DUP, TC26465-1MS were used as the QC samples for Chloride.
- Matrix Spike Recovery(s) for Chloride are outside control limits. Probable cause due to matrix interference.

Matrix AQ**Batch ID:** GP22949

- All samples were prepared within the recommended method holding time.
- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26485-1DUP, TC26485-1MS were used as the QC samples for Chloride.

Wet Chemistry By Method SM 2540C

Matrix AQ**Batch ID:** GN48912

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26404-3DUP were used as the QC samples for Solids, Total Dissolved.

Matrix AQ**Batch ID:** GN48950

- All samples were analyzed within the recommended method holding time.
- All method blanks for this batch meet method specific criteria.
- Sample(s) TC26485-1DUP were used as the QC samples for Solids, Total Dissolved.

Accutest Laboratories Gulf Coast (ALGC) certifies that this report meets the project requirements for analytical data produced for the samples as received at ALGC and as stated on the COC. ALGC certifies that the data meets the Data Quality Objectives for precision, accuracy and completeness as specified in the ALGC Quality Manual except as noted above. This report is to be used in its entirety. ALGC is not responsible for any assumptions of data quality if partial data packages are used

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: ARCADIS U.S., Inc.

Project/Site: Jal #4 Gas Plant - June 2013

TestAmerica Job ID: 560-40937-1

SDG: Quarterly Monitoring

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the MQL but greater than or equal to the SDL and the concentration is an estimated value.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Job ID: 560-40937-1

Laboratory: TestAmerica Corpus Christi

Narrative

Receipt

The samples were received on 6/29/2013 10:30 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 3.5° C. No analytical or quality issues were noted.

Login Sample Receipt Checklist

Client: ARCADIS U.S., Inc.

Job Number: 560-40937-1

SDG Number: Quarterly Monitoring

Login Number: 40937

List Source: TestAmerica Corpus Christi

List Number: 1

Creator: Adams, Christi L

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: ARCADIS U.S., Inc.
Project/Site: KMEP Jal #4 Gas Plant

TestAmerica Job ID: 560-42953-1
SDG: October 2013

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Case Narrative

Client: ARCADIS U.S., Inc.
Project/Site: KMEP Jal #4 Gas Plant

TestAmerica Job ID: 560-42953-1
SDG: October 2013

Job ID: 560-42953-1

Laboratory: TestAmerica Corpus Christi

Narrative

Receipt

The samples were received on 10/5/2013 10:10 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.1° C. No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: ARCADIS U.S., Inc.

Project/Site: Quarterly Monitoring for Jal #4 Gas Plan

TestAmerica Job ID: 560-44767-1

SDG: January 2014

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
4	MS, MSD: The analyte present in the original sample is greater than 4 times the matrix spike concentration; therefore, control limits are not applicable.

General Chemistry

Qualifier	Qualifier Description
F1	MS and/or MSD Recovery exceeds the control limits

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Case Narrative

Client: ARCADIS U.S., Inc.

Project/Site: Quarterly Monitoring for Jal #4 Gas Plan

TestAmerica Job ID: 560-44767-1

SDG: January 2014

Job ID: 560-44767-1

Laboratory: TestAmerica Corpus Christi

Narrative

Receipt

The samples were received on 1/11/2014 12:20 PM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperatures of the 5 coolers at receipt time were 0.8° C, 1.5° C, 1.8° C, 1.9° C and 2.2° C.

Metals

Method(s) EPA 6010B: It was noted that the matrix spike and matrix spike duplicate (MS/MSD) recoveries for sodium on 560-44767-34 were outside of the control limits. Matrix interferences inherent to the sample are suspected to be the cause of the recoveries. No other analytical or quality issues were noted.

General Chemistry

Method(s) SM 2540C: It was noted that the matrix spike and matrix spike duplicate (MS/MSD) recoveries for total dissolved solids (TDS) on 560-44767-2, -10 and -25 were outside of the control limits. Matrix interferences inherent to the sample are suspected to be the cause of the recoveries. The associated laboratory control sample (LCS) recovery was within acceptance limits. No other analytical or quality issues were noted.

Method Summary

Client: ARCADIS U.S., Inc.

Project/Site: Quarterly Monitoring for Jal #4 Gas Plan

TestAmerica Job ID: 560-44767-1

SDG: January 2014

Method	Method Description	Protocol	Laboratory
8260B	Volatile Organic Compounds (GC/MS)	SW846	TAL CC
6010B	Metals (ICP)	SW846	TAL CC
120.1	Conductivity, Specific Conductance	MCAWW	TAL CC
9251	Chloride	SW846	TAL CC
SM 2540C	Solids, Total Dissolved (TDS)	SM	TAL CC

Protocol References:

MCAWW = "Methods For Chemical Analysis Of Water And Wastes", EPA-600/4-79-020, March 1983 And Subsequent Revisions.

SM = "Standard Methods For The Examination Of Water And Wastewater",

SW846 = "Test Methods For Evaluating Solid Waste, Physical/Chemical Methods", Third Edition, November 1986 And Its Updates.

Question	Answer	Comment	
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A		1
The cooler's custody seal, if present, is intact.	True		2
Sample custody seals, if present, are intact.	N/A		3
The cooler or samples do not appear to have been compromised or tampered with.	True		4
Samples were received on ice.	True	Not Frozen	5
Cooler Temperature is acceptable.	True		6
Cooler Temperature is recorded.	True		7
COC is present.	True		8
COC is filled out in ink and legible.	True		9
COC is filled out with all pertinent information.	True		10
Is the Field Sampler's name present on COC?	True		11
There are no discrepancies between the containers received and the COC.	True		12
Samples are received within Holding Time.	True		
Sample containers have legible labels.	True		
Containers are not broken or leaking.	True		
Sample collection date/times are provided.	True		
Appropriate sample containers are used.	True		
Sample bottles are completely filled.	True		
Sample Preservation Verified.	True		
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True		
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	N/A		
Multiphasic samples are not present.	True		
Samples do not require splitting or compositing.	True		
Residual Chlorine Checked.	N/A

The test results in this report meet all 2003 NELAC and 2009 TNI requirements for accredited parameters, exceptions are noted in this report. This report may not be reproduced except in full, and with written approval from the laboratory. For questions please contact the Project Manager at the e-mail address or telephone number listed on this page.

This report has been electronically signed and authorized by the signatory. Electronic signature is intended to be the legally binding equivalent of a traditionally handwritten signature.

Results relate only to the items tested and the sample(s) as received by the laboratory.

Definitions/Glossary

Client: ARCADIS U.S., Inc.

Project/Site: Quarterly Monitoring for Jal #4 Gas Plan

TestAmerica Job ID: 560-44835-1

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Metals

Qualifier	Qualifier Description
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

Glossary

Abbreviation These commonly used abbreviations may or may not be present in this report.

□	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

TestAmerica Job ID: 560-44835-1

Job ID: 560-44835-1

Laboratory: TestAmerica Corpus Christi

Narrative

Receipt

The samples were received on 1/15/2014 10:00 AM; the samples arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 0.5° C. No analytical or quality issues were noted.

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A
