1.0 INTRODUCTION AND BACKGROUND

On behalf of Plains Pipeline, L.P. (Plains) and Fairweather Pipeline Services, L.L.C. (Fairweather), TRC Solutions, Inc. (TRC), formerly NOVA Safety and Environmental (NOVA), has prepared this Site Closure Request for the crude oil release site known as Plains Thomas to Pitchfork 8-Inch (SRS # 2014-227). The Release Site is located approximately nineteen (19) miles west of Jal, in Unit Letter C, Section 18, Township 25 South, and Range 34 East, in rural Lea County, New Mexico on property administered by the United States Department of the Interior, Bureau of Land Management (BLM). A Site Location Map and Site Details and Confirmation Soil Sample Location Map are provided as Figures 1 and 2, respectively. Release Site photographs are provided as Appendix A.

On August 14, 2014, a track hoe operated by Fairweather was working for Plains near the Plains Pitchfork Station. The track hoe struck a threaded fitting at the Plains Pitchfork Station Facility, resulting in a release of crude oil from the broken fitting. The crude oil release was estimated to be approximately one-hundred fifty (150) barrels (bbls). During initial response activities, approximately one-hundred ten (110) bbls of crude oil was recovered using a vacuum truck. Recovered crude oil was re-introduced into the Plains Transportation System. The release affected an area measuring approximately 18,000 square feet on the southern perimeter of the Plains Pitchfork Station and the adjacent pasture. The release flowed over an underground high-pressure (3,000 psig) salt water injection pipeline owned and operated by EOG Resources, Inc. and "pooled" in the southeast quadrant of the Release Site. In addition, the release affected a Plains Right-Of-Way (ROW) and planned pipeline route in proximity to the southern boundary of the Release Site. Employees of Fairweather constructed a soil berm around the crude oil release to mitigate the further migration of crude oil offsite. Employees of NOVA were working at a nearby Plains facility and assisted Fairweather during the initial response by scraping hydrocarbon saturated soil from the impacted area and stockpiling the soil on plastic, as required by the New Mexico Oil Conservation Division (NMOCD). At the time of the Release, underground piping was being installed immediately adjacent to the Plains Pitchfork Station and an open "bell hole" of unknown depth adjacent to the release point filled with crude oil. An unknown volume of crude oil from within the bell hole was recovered during initial response activities.

On August 15, 2014, Plains verbally notified the NMOCD Hobbs District Office of the release and on September 4, 2014, Plains submitted an NMOCD Initial Release Notification and Corrective Action (NMOCD Form C-141) to the NMOCD Hobbs District Office. The NMOCD verbal notifications and submissions are required under the New Mexico Administrative Code (NMAC) Title 19.15.29. All remediation activities at the Release Site were conducted in accordance with the State of New Mexico "Guidelines for the Remediation of Leaks, Spills and Releases" dated August 13, 1993. A copy of the Guidelines for the Remediation of Leaks, Spills and Releases" dated August 13, 1993 is provided as Appendix B. The initial Release Notification and Corrective Action (NMOCD Form C-141) is included as Appendix F.

In addition, on August 15, 2014, Plains verbally notified Mr. Randall Pair of the BLM of the Release. Notice of an "Undesirable Event" as required under the United State Code of Federal

Regulations (CFR) Title 14, Subtitle B, Chapter II, Subchapter C, Part 3160, Subpart 3162.4.1. Mr. Pair did not require Plains to file a written Undesirable Event Form.

Mr. Pair requested a "Cultural Resource Survey" be conducted prior to commencing remediation activities at the Release Site. On August 22, 2014, NOVA on behalf of Plains and Fairweather requested Boone Arch Services of NM, LLC. (Boone Arch) of Carlsbad, New Mexico, conducted a Cultural Resource Survey at and adjacent to the Release Site.

On August 26, 2014, Boone Arch conducted a records search at the BLM Carlsbad Field Office. During the records search it was noted the proposed project (Plains Thomas to Pitchfork 8-Inch) lies entirely with the boundaries of previously conducted archaeological surveys. In consultation with the BLM archaeologist, it was determined no additional archaeological survey was required. On August 27, 2014, NOVA received an email and document from Boone Arch indicating no additional archaeological survey was required. Please reference the Boone Arch Letter provided as Appendix C.

On September 15, 2014, a representative of NOVA met with Mr. Randall Pair at the Thomas to Pitchfork 8-Inch Release Site to discuss BLM requirements for remediation of the release. Mr. Pair verbally agreed to utilize the NMOCD regulatory guidelines for the Release Site remediation. Mr. Pair requested all excavated hydrocarbon impacted soil be transported to a disposal and the Release Site be backfilled with non-impacted material. In addition, Mr. Pair requested chloride analysis be conducted on all collected soil samples to demonstrate no chloride impact existed at the Release Site.

2.0 NMOCD SITE CLASSIFICATION

The NMOCD Site Classification criteria are explained in the "Guidelines for the Remediation of Leaks, Spills and Releases" dated August 13, 1993 and this document is provided in Appendix B.

According to data obtained from The New Mexico Office of the State Engineer (NMOSE), there are no water wells registered in Section 18, Township 25 South, Range 34 East. A depth to groundwater reference map utilized by the NMOCD indicates groundwater should be encountered at approximately one-hundred twenty five (125) feet bgs. The inferred depth to groundwater at the Plains Thomas to Pitchfork 8-Inch Release Site results in a score of zero (0) points being assigned to the site based on the NMOCD depth to groundwater criteria.

The water well database, maintained by the NMOSE, indicates there is no registered water wells located in Section 18. Based on the NMOCD ranking system zero (0) points will be assigned to the site as a result of the criteria.

There are no surface water bodies located within 1,000 feet of the site. Based on the NMOCD ranking system zero (0) points will be assigned to the site as a result of the criteria.

The NMOCD guidelines indicate the Plains Thomas to Pitchfork 8-Inch Release Site has ranking score of zero (0). Based on this score, the soil remediation levels for a site with a ranking score of zero (0) points are as follows:

- Benzene – 10 mg/Kg (ppm)
- BTEX – 50 mg/Kg (ppm)
- TPH – 5,000 mg/Kg (ppm)

The NMOCD chloride cleanup level concentrations are site specific and are determined by the NMOCD Hobbs District Office.

3.0 SUMMARY OF FIELD ACTIVITIES

On September 25, 2014, Fairweather mobilized a backhoe to the Release Site to conduct a limited soil investigation and determine the vertical extent of hydrocarbon impact at the Release Site. Trenches were advanced by Fairweather and technical oversight was provided by NOVA. Trench 1 was advanced in the "pooling area" located in southeast quadrant of the Release Site. Trench 1 was advanced to a total depth of approximately six (6) feet below ground surface (bgs). Soil samples were collected at two (2), four (4), and six (6) feet bgs. The soil samples (T-1 @ 2', T-1 @ 4', and T-1 @ 6') were submitted to Permian Basin Environmental Lab, LP located in Midland, Texas. The soil samples were analyzed for concentrations of benzene, toluene, ethylbenzene, and xylene (BTEX), total petroleum hydrocarbon (TPH) and chloride using Methods SW-846 8021B, SW-846 8015M and E 300.0, respectively. The analytical results indicated benzene concentrations ranged from 2.62 mg/Kg in soil sample T-1 @ 2' to 33.6 mg/Kg for soil sample T-1 @ 6'. BTEX concentrations ranged from 213.77 mg/Kg for soil sample T-1 @ 4' to 537.4 mg/Kg for soil sample T-1 @ 6'. TPH concentrations ranged from 8,561 mg/Kg for soil sample T-1 @ 4' to 18,760 mg/Kg for soil sample T-1 @ 6'. Chloride concentrations ranged from less than the applicable laboratory method detection limit (MDL) for soil samples T-1 @ 4' and T-1 @ 6' to 8.59 mg/Kg for soil sample T-1 @ 2'. Based on the analytical results, additional vertical delineation was warranted in the Trench 1 area. Please reference Figure 2 for the location of Trench 1 and other pertinent site details. A table of BTEX, TPH, and Chloride Concentrations in Soil is provided as Table 1. Analytical Laboratory Reports are provided as Appendix D.

Trench 2 was advanced in the northwest quadrant of the Release Site, Trench 2 was advanced to a total depth of approximately six (6) feet bgs. Soil samples were collected at two (2), four (4), and six (6) feet bgs. The soil samples (T-2 @ 2', T-2 @ 4', and T-2 @ 6') were submitted to the laboratory for benzene, BTEX, TPH, and chloride analysis. The analytical results indicated benzene concentrations ranged from 0.00326 mg/Kg for soil sample T-2 @ 4' to 0.0139 mg/Kg for soil sample T-2 @ 2'. BTEX concentrations ranged from 0.01604 mg/Kg for soil sample T-2 @ 4' to 0.06601 mg/Kg for soil sample T-2 @ 4'. TPH concentrations ranged from less than the applicable laboratory MDL for soil samples T-2 @ 4' and T-2 @ 6' to 59.6 mg/Kg for soil sample T-2 @ 2'. Chloride concentration were less than the laboratory MDL for the three (3) submitted soil samples. Please reference Figure 2 for the location of Trench 2 and other pertinent site details.

3.1 Plains Right-Of-Way Excavation Activities

On October 16, 2014, Fairweather employees mobilized two (2) track hoes to the Release Site to begin excavation of affected Plains ROW. Excavation activities associated with the Plains ROW were expedited to facilitate the installation of the Plains pipeline. Soil excavated from the Plains ROW was stockpiled to the north of the Plains ROW, pending future transportation to Sundance Services in Eunice, New Mexico.

In addition, Trench-3 was advanced to further delineate the vertical extent of impact in the Plains ROW. Trench-3 was located approximately fifteen (15) feet west of Trench-1 and advanced to a total depth of approximately ten (10) feet bgs. Soil samples were collected at six (6), eight (8), and ten (10) feet bgs and submitted to the laboratory for analysis. The analytical results indicated benzene, BTEX, TPH, and chloride concentrations were less than the applicable laboratory MDL. Please reference Figure 2 for the location of Trench 3 and other pertinent site details.

On October 20, 2014, excavation of the Plains ROW was completed to depths ranging from approximately five (5) feet bgs on the western extent of the excavation to approximately nine (9) feet bgs on the eastern extent of the excavation. On October 20, 2014, three (3) confirmation floor soil samples (Floor-1 @ 9', Floor-2 @ 6', and Floor-3 @ 5') were collected from the Plains ROW and submitted to the laboratory for analysis. The analytical results indicated benzene concentrations ranged from less than the applicable laboratory MDL for soil samples Floor-1 @ 9' and Floor-3 @ 5' to 0.293 mg/kg for soil sample Floor-2 @ 6'. BTEX concentrations ranged from 0.04711 mg/Kg for soil sample Floor-1 @ 9' to 39.273 mg/Kg for soil sample Floor-2 @ 6'. TPH concentrations ranged from less than the laboratory MDL of 27.2 mg/Kg for soil sample Floor-1 @ 9' to 2,680 mg/Kg for soil sample Floor-2 @ 6' and chloride concentrations ranged from less than the applicable laboratory MDL for soil sample Floor -2 @ 6' and Floor-3 @ 5' to 15.2 mg/Kg for soil sample Floor-1 @ 9'. Please reference Figure 2 for soil sample locations and other pertinent site details. A table of BTEX, TPH, and Chloride Concentrations in Soil is provided as Table 1. Analytical Laboratory Reports are provided as Appendix D.

On October 22, 2014, five (5) confirmation excavation sidewall soil samples (ESW-1 @ 8', SSW-1 @ 8', SSW-2 @ 5', SSW-3 @ 4', and WSW-1 @ 4') were collected and submitted to the laboratory for analysis. The analytical results indicated benzene concentrations ranged from less than the applicable laboratory MDL for soil samples ESW-1 @ 8', SSW-3 @ 4', and WSW-1 @ 4' to 0.0113 mg/Kg for soil sample SSW-1 @ 8'. BTEX concentrations ranged from less than the applicable laboratory MDL for soil samples ESW-1 @ 8' and WSW-1 @ 4' to 0.9575 mg/Kg for soil sample SSW-1 @ 8'. TPH concentrations ranged from less than the applicable laboratory MDL for soil samples ESW-1 @ 8', SSW-3 @ 4', and WSW-1 @ 4' to 468.7 mg/Kg for soil sample SSW-1 @ 8' and chloride concentrations ranged from less than the applicable laboratory MDL for soil samples ESW-1 @ 8', SSW-1 @ 8', SSW-2 @ 5', and SSW-3 @ 4' to 29.1 mg/Kg for soil sample WSW-1 @ 4'. Confirmation excavation sidewall soil samples were not collected from the north sidewall of the Plains ROW excavation activities. Excavation of the north sidewall was addressed during activities conducted during the Main Excavation of 2015. Please reference Figure 2 for soil sample locations and other pertinent site details.

Based on the analytical results of the three (3) confirmation floor and five (5) sidewall soil samples, no further excavation was warranted. The analytical results indicated all concentrations of benzene, BTEX, TPH, and chloride were less than the NMOCD regulatory guidelines.

On October 27, 2014, TRC on behalf of Plains and Fairweather, verbally requested "permission to backfill" the Plains ROW excavation from the NMOCD. On October 30, 2014, NMOCD granted approval to backfill the Plains ROW excavation in email correspondence.

On October 31, 2014, TRC on behalf of Plains and Fairweather, requested and received BLM "permission to backfill" the Plains ROW excavation in an email. Please reference NMOCD and BLM correspondence provided in Appendix E.

Following the approval to backfill the excavation by the NMOCD and BLM, the excavation was backfilled with locally obtained non-impacted soil by employees of Fairweather. On October 16, 2014, a five-point composite soil stockpile sample (Vaca SP Composite) was collected from the prospective backfill material and submitted to the laboratory for analysis of benzene, BTEX, TPH, and chloride. The analytical results indicated concentrations of benzene, BTEX, TPH, and chloride were less than the applicable laboratory MDL.

Approximately 2,200 cubic yards (cy) of impacted soil was excavated from the Plains ROW excavation and staged to the north of the ROW excavation. The impacted soil was transported to Sundance Services in Eunice, New Mexico during activities conducted in 2015.

3.2 Main Excavation Activities

On March 16, 2015, activities resumed at the Plains Thomas to Pitchfork 8-Inch Release Site. Approximately 2,200 cy of impacted soil previously stockpiled north of the Plains ROW excavation was transported under manifest to Sundance Services in Eunice, New Mexico. Following removal of the previously stockpiled impacted soil, main excavation activities commenced. Sundance Services Manifests are provided on the enclosed disk.

From March 19, 2015 through April 10, 2015, excavation, loading and transportation activities were conducted concurrently at the Plains Thomas to Pitchfork 8-Inch Release Site. The release was excavated to depths ranging from approximately four (4) feet to approximately fourteen (14) feet bgs.

Due to safety and potential adverse environmental concerns, the EOG Resources, 3,000 psig High-Pressure Water Injection Pipeline was not excavated and was supported by a "soil plug".

On April 10, 2015, six (6) confirmation floor soil samples (Floor-1 @ 6', Floor-2 @ 6', Floor-3 @ 6', Floor-4 @ 14', Floor-5 @ 10', and Floor-6 @ 8') were collected and submitted to the laboratory for analysis. The analytical results indicated benzene concentrations were less than the applicable laboratory MDL for all six (6) of the submitted soil samples. BTEX concentrations were less than the laboratory MDL for all six (6) soil samples, with the exception of soil sample Floor-4 @ 14', which exhibited a BTEX concentration of 0.00164 mg/Kg. TPH concentrations were less than the applicable laboratory MDL, with the exception of soil sample Floor-4 @ 14,

which exhibited a TPH concentration of 275.3 mg/Kg. Chloride concentrations ranged from less than the applicable laboratory MDL for soil samples Floor-1 @ 6', Floor-3 @ 6', and Floor-6 @ 8' to 119 mg/Kg for soil sample Floor-5 @ 10'. Please reference Figure 2 for soil sample locations and other pertinent site details. A table of BTEX, TPH, and Chloride Concentrations in Soil is provided as Table 1. Analytical Laboratory Reports are provided as Appendix D.

In addition, ten (10) confirmation sidewall soil samples (WSW-1 @ 4', NSW-2 @ 4', NSW-1 @ 4, ESW-1 @ 4', NSW-3 @ 11', ESW-2 @ 4', SSW-1 @ 9', NSW-4 @ 7', WSW-2 @ 7', and SSW-2 @ 7') were collected and submitted to the laboratory for analysis. The analytical results indicated benzene concentrations were less than the applicable laboratory MDL for all ten (10) of the submitted soil samples. BTEX concentrations were less than the laboratory MDL for all ten (10) soil samples, with the exception of soil sample SSW-1 @ 9', which exhibited a BTEX concentration of 0.01372 mg/Kg. TPH concentrations were less than the applicable laboratory MDL, with the exception of SSW-1 @ 9', which exhibited a TPH concentration of 460.3 mg/Kg. Chloride concentrations ranged from less than the applicable laboratory MDL for soil samples WSW-2 @ 7' and SSW-2 @ 7' to 29.6 mg/Kg for soil sample WSW-1 @ 4'. Please reference Figure 2 for soil sample locations and other pertinent site details.

Based on the analytical results of the six (6) confirmation floor and ten (10) sidewall soil samples, no further excavation was warranted. The analytical results indicated all concentrations of benzene, BTEX, TPH, and chloride were less than the NMOCD regulatory guidelines.

On April 20, 2015, TRC on behalf of Plains and Fairweather, requested and received NMOCD permission to backfill the Main Excavation. Please reference NMOCD and BLM correspondence provided in Appendix E.

On April 20, 2015, TRC on behalf of Plains and Fairweather, requested BLM "permission to backfill" the main excavation. On April 24, 2015, BLM granted approval to backfill the main excavation in email correspondence.

Following the approval to backfill the excavation by the NMOCD and BLM, the excavation was backfilled with locally obtained non-impacted soil by employees of TRC. In addition, approximately 2,592 cy of caliche was purchased from The New Mexico State Land Office.

A total of approximately 7,744 cy of impacted soil was excavated from the Thomas to Pitchfork 8-Inch Release Site and transported to Sundance Services in Eunice, New Mexico during remediation activities. Please reference Sundance Services Disposal Manifests on the attached disk.

On May 20, 2015, the Release Site and areas disturbed during remediation activities (approximately 1.6 acres) was seeded by broadcasting approximately 3.2 pounds of San Dropseed, 3.2 pounds of Sand Lovegrass and 6.4 pounds of Plains Bristlegrass, as requested by the BLM. Following the broadcasting of the seed mixture a chain was dragged by a tractor to set the seed in the soil.

4.0 QA/QC PROCEDURES

4.1 Soil Sampling

Soil samples were obtained utilizing single-use, disposable, latex gloves. The soil sample was placed in a sterile glass container equipped with a Teflon-lined lid furnished by the analytical laboratory. The container was filled to capacity to limit the amount of headspace present. Each container was labeled and placed on ice in an insulated cooler. Upon selection of samples for analysis, the cooler was sealed for shipment to the laboratory. Proper chain-of-custody documentation was maintained throughout the sampling process.

Soil samples were delivered to Permian Basin Environmental Lab, Midland, Texas for BTEX, TPH, and chloride analyses using the method described below.

- TPH concentrations in accordance with modified EPA Method 8015M GRO/DRO
- BTEX concentrations in accordance with EPA Method SW-846 8021b
- Chloride concentrations in accordance with EPA Method E300.0

4.2 Decontamination of Equipment

Soil sampling tools such as small hand shovels were washed with Liqui-Nox® detergent and rinsed with distilled water between the collection of soil samples.

4.3 Laboratory Protocol

The laboratory was responsible for proper QA/QC procedures after signing the chain-of-custody form.

5.0 CLOSURE REQUEST

Based on the analytical results of confirmation soil samples obtained from the floor and sidewalls of the excavation, TRC recommends Plains and/or Fairweather provide the NMOCD and BLM a copy of this Site Closure Request and request the NMOCD and BLM grant closure to the Thomas to Pitchfork 8-Inch Release Site.

6.0 LIMITATIONS

TRC has prepared this Site Closure Request to the best of its ability. No other warranty, expressed or implied, is made or intended.

TRC has examined and relied upon documents referenced in the report and has relied on oral statements made by certain individuals. TRC has not conducted an independent examination of the facts contained in referenced materials and statements. We have presumed the genuineness of the documents and that the information provided in documents or statements is true and accurate. TRC has prepared this report in a professional manner, using the degree of skill and care

exercised by similar environmental consultants. TRC also notes that the facts and conditions referenced in this report may change over time and the conclusions and recommendations set forth herein are applicable only to the facts and conditions as described at the time of this report.

This report has been prepared for the benefit of Plains Pipeline, L.P. and Fairweather Pipeline Services, LLC. The information contained in this report, including all exhibits and attachments, may not be used by any other party without the express consent of TRC and/or Plains Pipeline L.P. and/or Fairweather Pipeline Services, LLC.

IX. FINAL REPORT

INTRODUCTION

The following document is to be used as a **guide** on all federal, state and fee lands when remediating contaminants resulting from leaks, spills and releases of oilfield wastes or products. The New Mexico Oil Conservation Division (OCD) requires that corrective actions be taken for leaks, spills or releases of any material which has a reasonable probability to injure or be detrimental to public health, fresh waters, animal or plant life, or property or unreasonably interfere with the public welfare or use of the property. These guidelines are intended to provide direction for remediation of soils and fresh waters contaminated as a result of leaks, spills or releases of oilfield wastes and products in a manner that assures protection of fresh waters, public health and the environment.

Fresh waters (to be protected) includes the water in lakes, playas, surface waters of all streams regardless of the quality of the water within any given reach, and all underground waters containing 10,000 milligrams per liter (mg/l) or less of total dissolved solids (TDS) except for which, after notice and hearing, it is found that there is no present or reasonably foreseeable beneficial use which would be impaired by contamination of such waters. The water in lakes and playas shall be protected from contamination even though it may contain more than 10,000 mg/l of TDS unless it can be shown that hydrologically connected fresh ground water will not be adversely affected.

Procedures may deviate from the following guidelines if it can be shown that the proposed procedure will either remediate, remove, isolate or control contaminants in such a manner that fresh waters, public health and the environment will not be impacted. Specific constituents and/or requirements for soil and ground water analysis and/or remediation may vary depending on site specific conditions. Deviations from approved plans will require OCD notification and approval.

****** Note:** **Notification to OCD of leaks, spills and releases does not relieve an operator of responsibility for compliance with any other federal, state or local law and/or regulation regarding the incident. Other agencies (ie. BLM, Indian Tribes, etc) may also have guidelines or requirements for remediation of leaks spills and releases.**

I. NOTIFICATION OF LEAK, SPILL OR RELEASE

Leaks, spills and releases of any wastes or products from oilfield operations are required to be reported to the OCD pursuant to OCD Rule 116 (Appendix A) or New Mexico Water Quality Control Commission (WQCC) Regulation 1-203 (Appendix B). Appendix C contains the phone numbers and addresses for reporting incidents to the OCD district and Santa Fe offices. Notification will include all information required under the respective rule or regulation. Below is a description of some of the information required:

A. RESPONSIBLE PARTY AND LOCAL CONTACT

The name, address and telephone number of the person/persons in charge of the facility/operation as well as the owner and/or operator of the facility/operation and a local contact.

B. FACILITY

The name and address of the facility or operation where the incident took place and the legal location listed by quarter-quarter, section, township and range, and by distance and direction from the nearest town or prominent landmark so that the exact site location can be readily located on the ground.

C. TIME OF INCIDENT

The date, time and duration of the incident.

D. DISCHARGE EVENT

A description of the source and cause of the incident.

E. TYPE OF DISCHARGE

A description of the nature or type of discharge. If the material leaked, spilled or released is anything other than crude oil, condensate or produced water include its chemical composition and physical characteristics.

F. QUANTITY

The known or estimated volume of the discharge.

G. SITE CHARACTERISTICS

The relevant general conditions prevailing at the site including precipitation, wind conditions, temperature, soil type, distance to nearest residence and population centers and proximity of fresh water wells or watercourse (ie. any river, lake, stream, playa, arroyo, draw, wash, gully or natural or man-made channel through which water flows or has flowed).

H. IMMEDIATE CORRECTIVE ACTIONS

Any initial response actions taken to mitigate immediate threats to fresh waters, public health and the environment.

II. INITIAL RESPONSE ACTIONS

Upon learning of a leak, spill or release of any material which has a reasonable probability to injure or be detrimental to public health, fresh waters, animal or plant life, or property or unreasonably interfere with the public welfare or use of the property, the responsible party (RP) should take the following immediate actions unless the actions could create a safety hazard which would result in a threat to personal or public injury:

A. SOURCE ELIMINATION AND SITE SECURITY

The RP should take the appropriate measures to stop the source of the leak, spill or release and limit access to the site as necessary to reduce the possibility of public exposure.

B. CONTAINMENT

Once the site is secure, the RP should take steps to contain the materials leaked, spilled or released by construction of berms or dikes, the use of absorbent pads or other containment actions to limit the area impacted by the event and prevent potential fresh water contaminants from migrating to watercourses or areas which could pose a threat to public health and safety.

C. SITE STABILIZATION

After containment, the RP should recover any products or wastes which can be physically removed from the surface within the containment area. The disposition of all wastes or products removed from the site must be approved by the OCD.

III. SITE ASSESSMENT

Prior to final closure (Section VIII), soils into which nonrecoverable products or wastes have infiltrated and which have a reasonable probability to injure or be detrimental to public health, fresh waters, animal or plant life, or property or unreasonably interfere with the public welfare or use of the property should be assessed for their potential environmental impacts and remediated according to the procedures contained in the following sections. Assessment results form the basis of any required remediation. Sites will be assessed for severity of contamination and potential environmental and public health threats using a risk based ranking system.

The following characteristics should be determined in order to evaluate a sites potential risks, the need for remedial action and, if necessary, the level of cleanup required at the site:

A. GENERAL SITE CHARACTERISTICS

1. Depth To Ground Water

The operator should determine the depth to ground water at each site. The depth to ground water is defined as the vertical distance from the lowermost contaminants to the seasonal high water elevation of the ground water. If the exact depth to ground water is unknown, the ground water depth can be estimated using either local water well information, published regional ground water information, data on file with the New Mexico State Engineer Office or the vertical distance from adjacent ground water or surface water.

2. Wellhead Protection Area

The operator should determine the horizontal distance from all water sources including private and domestic water sources. Water sources are defined as wells, springs or other sources of fresh water extraction. Private and domestic water sources are those water sources used by less than five households for domestic or stock purposes.

3. Distance To Nearest Surface Water Body

The operator should determine the horizontal distance to all downgradient surface water bodies. Surface water bodies are defined as perennial rivers, streams, creeks, irrigation canals and ditches, lakes, ponds and playas.

B. SOIL/WASTE CHARACTERISTICS

Soils/wastes within and beneath the area of the leak, spill or release should be evaluated to determine the type and extent of contamination at the site. In order to assess the level of contamination, observations should be made of the soils at the surface and samples of the impacted soils should be taken in the leak, spill or release area. Observations should note whether previous leaks, spills or releases have occurred at the site. Additional samples may be required to completely define the lateral and vertical extent of contamination. Soil samples should be obtained according to the sampling procedures in Sections V.A. and V.B. This may be accomplished using a backhoe, drill rig, hand auger, shovel or other means.

Initial assessment of soil contaminant levels is not required if an operator proposes to determine the final soil contaminant concentrations after a soil removal or remediation pursuant to section VI.A.

Varying degrees of contamination described below may co-exist at an individual site. The following sections describe the degrees of contamination that should be documented during the

assessment of the level of soil contamination:

1. **Highly Contaminated/Saturated Soils**

Highly contaminated/saturated soils are defined as those soils which contain a free liquid phase or exhibit gross staining.

2. **Unsaturated Contaminated Soils**

Unsaturated contaminated soils are defined as soils which are not highly contaminated/saturated, as described above, but contain benzene, toluene, ethylbenzene and xylenes (BTEX) and total petroleum hydrocarbons (TPH) or other potential fresh water contaminants unique to the leak, spill or release. Action levels and sampling and analytical methods for determining contaminant concentrations are described in detail in Sections IV. and V.

**** **(NOTE: Soils contaminated as a result of spills, leaks or releases of non-exempt wastes must be evaluated for all RCRA Subtitle C hazardous waste characteristics. The above definitions apply only to oilfield contaminated soils which are exempt from federal RCRA Subtitle C hazardous waste provisions and nonexempt oilfield contaminated soils which are characteristically nonhazardous according to RCRA Subtitle C regulations. Any nonexempt contaminated soils which are determined to be characteristically hazardous cannot be remediated using this guidance document and will be referred to the New Mexico Environment Department Hazardous Waste Program.)**

C. **GROUND WATER QUALITY**

If ground water is encountered during the soil/waste characterization of the impacted soils, a sample should be obtained to assess the incidents potential impact on ground water quality. Ground water samples should be obtained using the sampling procedures in Section V.C. Monitor wells may be required to assess potential impacts on ground water and the extent of ground water contamination, if there is a reasonable probability of ground water contamination based upon the extent and magnitude of soil contamination defined during remedial activities.

IV. SOIL AND WATER REMEDIATION ACTION LEVELS

A. **SOILS**

The sections below describe the OCD's recommended remediation action levels for soils contaminated with petroleum hydrocarbons. Soils contaminated with substances other than petroleum hydrocarbons may be required to be remediated based

upon the nature of the contaminant and it's potential to impact fresh waters, public health and the environment.

1. Highly Contaminated/Saturated Soils

All highly contaminated/saturated soils should be remediated insitu or excavated to the maximum extent practicable. These soils should be remediated using techniques described in Section VI.A to the contaminant specific level listed in Section IV.A.2.b.

2. Unsaturated Contaminated Soils

The general site characteristics obtained during the site assessment (Section III.A.) will be used to determine the appropriate soil remediation action levels using a risk based approach. Soils which are contaminated by petroleum constituents will be scored according to the ranking criteria below to determine their relative threat to public health, fresh waters and the environment.

a. Ranking Criteria

Depth To Ground Water	Ranking Score
<50 feet	20
50 - 99	10
>100	0

Wellhead Protection Area

<1000 feet from a water source, or; <200 feet from private domestic water source	
Yes	20
No	0

Distance To Surface Water Body

<200 horizontal feet	20
200 - 1000 horizontal feet	10
>1000 horizontal feet	0

b. Recommended Remediation Action Level

The total ranking score determines the degree of remediation that may be required at any given site. The total ranking score is the sum of all four individual ranking criteria listed in Section IV.A.2.a. The table below lists the remediation action level that may be required for the appropriate total ranking score.

(NOTE: The OCD retains the right to require remediation to more stringent levels than those proposed below if warranted by site specific conditions (ie. native soil type, location relative to population centers and future use of the site or other appropriate site specific conditions.)

	Total Ranking Score		
	>19	10 - 19	0 - 9
Benzene (ppm) *	10	10	10
BTEX (ppm) *	50	50	50
TPH (ppm) **	100	1000	5000

* A field soil vapor headspace measurement (Section V.B.1) of 100 ppm may be substituted for a laboratory analysis of the Benzene and BTEX concentration limits.

** The contaminant concentration for TPH is the concentration above background levels.

B. GROUND WATER

Contaminated ground water is defined as ground water of a present or foreseeable beneficial use which contains free phase products, dissolved phase volatile organic constituents or other dissolved constituents in excess of the natural background water quality. Ground water contaminated in excess of the WQCC ground water standards or natural background water quality will require remediation.

V. SOIL AND WATER SAMPLING PROCEDURES

Below are the sampling procedures for soil and ground water contaminant investigations of leaks, spills or releases of RCRA Subtitle C exempt oil field petroleum hydrocarbon wastes. Leaks, spills or releases of non-exempt RCRA wastes must be tested to demonstrate that the wastes are not characteristically hazardous according to RCRA regulations. Sampling for additional constituents may be required based upon the nature of the contaminant which was leaked, spilled or released.

A. HIGHLY CONTAMINATED OR SATURATED SOILS

The following method is used to determine if soils are highly contaminated or saturated:

1. Physical Observations

Study a representative sample of the soil for observable free petroleum hydrocarbons or immiscible phases and gross staining. The immiscible phase may range from a free hydrocarbon to a sheen on any associated aqueous phase. A soil exhibiting any of these characteristics is considered highly contaminated or saturated.

B. UNSATURATED CONTAMINATED SOILS

The following methods may be used for determining the magnitude of contamination in unsaturated soils:

1. Soil Sampling Procedures for Headspace Analysis

A headspace analysis may be used to determine the total volatile organic vapor concentrations in soils (ie. in lieu of a laboratory analysis for benzene and BTEX but not in lieu of a TPH analysis). Headspace analysis procedures should be conducted according to OCD approved industry standards or other OCD-approved procedures. Accepted OCD procedures are as follows:

a) Fill a 0.5 liter or larger jar half full of sample and seal the top tightly with aluminum foil or fill

a one quart zip-lock bag one-half full of sample and seal the top of the bag leaving the remainder of the bag filled with air.

b) Ensure that the sample temperature is between 15 to 25 degrees Celsius (59-77 degrees Fahrenheit).

c) Allow aromatic hydrocarbon vapors to develop within the headspace of the sample jar or bag for 5 to 10 minutes. During this period, the sample jar should be shaken vigorously for 1 minute or the contents of the bag should be gently massaged to break up soil clods.

d) If using a jar, pierce the aluminum foil seal with the probe of either a PID or FID organic vapor meter (OVM), and then record the highest (peak) measurement. If using a bag, carefully open one end of the bag and insert the probe of the OVM into the bag and re-seal the bag around the probe as much as possible to prevent vapors from escaping. Record the peak measurement. The OVM must be calibrated to assume a benzene response factor.

2. Soil Sampling Procedures For Laboratory Analysis

a. Sampling Procedures

Soil sampling for laboratory analysis should be conducted according to OCD approved industry standards or other OCD-approved procedures. Accepted OCD soil sampling procedures and laboratory analytical methods are as follows:

i) Collect samples in clean, air-tight glass jars supplied by the laboratory which will conduct the analysis or from a reliable laboratory equipment supplier.

ii) Label the samples with a unique code for each sample.

iii) Cool and store samples with cold packs or on ice.

iv) Promptly ship sample to the lab for analysis following chain of custody procedures.

v) All samples must be analyzed within the holding times for the laboratory analytical method specified by EPA.

b. Analytical Methods

All soil samples must be analyzed using EPA methods, or by other OCD approved methods and must

be analyzed within the holding time specified by the method. Below are laboratory analytical methods commonly accepted by OCD for analysis of soil samples analyzed for petroleum related constituents. Additional analyses may be required if the substance leaked, spilled or released has been anything other than petroleum based fluids or wastes.

i) Benzene, toluene, ethylbenzene and xylene

- EPA Method 602/8020

ii) Total Petroleum Hydrocarbons

- EPA Method 418.1, or;
- EPA Method Modified 8015

C. GROUND WATER SAMPLING

If an investigation of ground water quality is deemed necessary, it should be conducted according to OCD approved industry standards or other OCD-approved procedures. The following methods are standard OCD accepted methods which should be used to sample and analyze ground water at RCRA Subtitle C exempt sites (Note: The installation of monitor wells may not be required if the OCD approves of an alternate ground water investigation or sampling technique):

1. Monitor Well Installation/Location

One monitor well should be installed adjacent to and hydrologically down-gradient from the area of the leak, spill or release to determine if protectable fresh water has been impacted by the disposal activities. Additional monitor wells, located up-gradient and down-gradient of the leak, spill or release, may be required to delineate the full extent of ground water contamination if ground water underlying the leak, spill or release has been found to be contaminated.

2. Monitor Well Construction

a) Monitor well construction materials should be:

i) selected according to industry standards;

ii) chemically resistant to the contaminants to be monitored; and

iii) installed without the use of glues/adhesives.

b) Monitor wells should be constructed according to OCD approved industry standards to prevent migration of contaminants along the well casing. Monitor wells should be constructed with a minimum of fifteen

(15) feet of well screen. At least five (5) feet of the well screen should be above the water table to accommodate seasonal fluctuations in the static water table.

3. Monitor Well Development

When ground water is collected for analysis from monitoring wells, the wells should be developed prior to sampling. The objective of monitor well development is to repair damage done to the formation by the drilling operation so that the natural hydraulic properties of the formation are restored and to remove any fluids introduced into the formation that could compromise the integrity of the sample. Monitoring well development is accomplished by purging fluid from the well until the pH and specific conductivity have stabilized and turbidity has been reduced to the greatest extent possible.

4. Sampling Procedures

Ground water should be sampled according to OCD accepted standards or other OCD approved methods. Samples should be collected in clean containers supplied by the laboratory which will conduct the analysis or from a reliable laboratory equipment supplier. Samples for different analyses require specific types of containers. The laboratory can provide information on the types of containers and preservatives required for sample collection. The following procedures are accepted by OCD as standard sampling procedures:

a) Monitor wells should be purged of a minimum of three well volumes of ground water using a clean bailer prior to sampling to ensure that the sample represents the quality of the ground water in the formation and not stagnant water in the well bore.

b) Collect samples in appropriate sample containers containing the appropriate preservative for the analysis required. No bubbles or headspace should remain in the sample container.

c) Label the sample containers with a unique code for each sample.

d) Cool and store samples with cold packs or on ice.

e) Promptly ship sample to the lab for analysis following chain of custody procedures.

f) All samples must be analyzed within the holding times for the laboratory analytical method specified by EPA.

5. Ground Water Laboratory Analysis

Samples should be analyzed for potential ground water contaminants contained in the waste stream, as defined by the WQCC Regulations. All ground water samples must be analyzed using EPA methods, or by other OCD approved methods and must be analyzed within the holding time specified by the method. Below are OCD accepted laboratory analytical methods for analysis of ground water samples analyzed for petroleum related constituents. Additional analyses may be required if the substance leaked, spilled or release has been anything other than a petroleum based fluid or waste.

a. Analytical Methods

i.) Benzene, Toluene, Ethylbenzene and Xylene

- EPA Method 602/8020

ii.) Major Cations and Anions

- Various EPA or standard methods

iii.) Heavy Metals

- EPA Method 6010, or;
- Various EPA 7000 series methods

iv.) Polynuclear Aromatic Hydrocarbons

- EPA Method 8100

VI. REMEDIATION

The following discussion summarizes recommended techniques for remediation of contaminated soil and ground water as defined in Section IV.A. and IV.B. OCD approval for remediation of an individual leak, spill or release site is not required if the company is operating under an OCD approved spill containment plan. All procedures which deviate from the companies spill containment plan must be approved by OCD.

A. SOIL REMEDIATION

When RCRA Subtitle C exempt or RCRA nonhazardous petroleum contaminated soil requires remediation, it should be remediated and managed according to the criteria described below or by other OCD approved procedures which will remove, treat, or isolate contaminants in order to protect fresh waters, public health and the environment.

In lieu of remediation, OCD may accept an assessment of risk which demonstrates that the remaining contaminants will not pose a threat to present or foreseeable beneficial use of fresh waters, public health and the environment.

1. Contaminated Soils

Highly contaminated/saturated soils and unsaturated contaminated soils exceeding the standards described in Section IV.A. should be either:

a) Excavated from the ground until a representative sample from the walls and bottom of the excavation is below the contaminant specific remediation level listed in Section IV.A.2.b or an alternate approved remediation level, or;

b) Excavated to the maximum depth and horizontal extent practicable. Upon reaching this limit a sample should be taken from the walls and bottom of the excavation to determine the remaining levels of soil contaminants, or;

c) Treated in place, as described in Section VI.A.2.b.ii. - Treatment of Soil in Place, until a representative sample is below the contaminant specific remediation level listed in Section IV.A.2.b, or an alternate approved remediation level, or;

d) Managed according to an approved alternate method.

2. Soil Management Options

All soil management options must be approved by OCD. The following is a list of options for either on-site

treatment or off-site treatment and/or disposal of contaminated soils:

a. Disposal

Excavated soils may be disposed of at an off-site OCD approved or permitted facility.

b. Soil Treatment and Remediation Techniques

i. Landfarming

Onetime applications of contaminated soils may be landfarmed on location by spreading the soil in an approximately six inch lift within a bermed area. Only soils which do not contain free liquids can be landfarmed. The soils should be disced regularly to enhance biodegradation of the contaminants. If necessary, upon approval by OCD, moisture and nutrients may be added to the soil to enhance aerobic biodegradation.

In some high risk areas an impermeable liner may be required to prevent leaching of contaminants into the underlying soil.

Landfarming sites that will receive soils from more than one location are considered centralized sites and must be approved separately by the OCD prior to operation.

ii. Insitu Soil Treatment

Insitu treatment may be accomplished using vapor venting, bioremediation or other approved treatment systems.

iii. Alternate Methods

The OCD encourages alternate methods of soil remediation including, but not limited to, active soil aeration, composting, bioremediation, solidification, and thermal treatment.

B. GROUND WATER REMEDIATION

1. Remediation Requirements

Ground water remediation activities will be reviewed and approved by OCD on a case by case basis prior to commencement of remedial activities. When contaminated ground water exceeds WQCC ground water standards, it

should be remediated according to the criteria described below.

a. Free Phase Contamination

Free phase floating product should be removed from ground water through the use of skimming devices, total-fluid type pumps, or other OCD-approved methods.

b. Dissolved Phase Contamination

Ground water contaminated with dissolved phase constituents in excess of WQCC ground water standards can be remediated by either removing and treating the ground water, or treating the ground water in place. If treated waters are to be disposed of onto or below the ground surface, a discharge plan must be submitted and approved by OCD.

c. Alternate Methods

The OCD encourages other methods of ground water remediation including, but not limited to, air sparging and bioremediation. Use of alternate methods must be approved by OCD prior to implementation.

VII. TERMINATION OF REMEDIAL ACTION

Remedial action may be terminated when the criteria described below have been met:

A. SOIL

Contaminated soils requiring remediation should be remediated so that residual contaminant concentrations are below the recommended soil remediation action level for a particular site as specified in Section IV.A.2.b.

If soil action levels cannot practicably be attained, an evaluation of risk may be performed and provided to OCD for approval showing that the remaining contaminants will not pose a threat to present or foreseeable beneficial use of fresh water, public health and the environment.

B. GROUND WATER

A ground water remedial action may be terminated if all recoverable free phase product has been removed, and the concentration of the remaining dissolved phase contaminants in the ground water does not exceed New Mexico WQCC water quality standards or background levels. Termination of remedial action will be approved by OCD upon a demonstration of completion of remediation as described in above.

VIII. FINAL CLOSURE

Upon termination of any required remedial actions (Section VII.) the area of a leak, spill or release may be closed by backfilling any excavated areas, contouring to provide drainage away from the site, revegetating the area or other OCD approved methods.

IX. FINAL REPORT

Upon completion of remedial activities a final report summarizing all actions taken to mitigate environmental damage related to the leak, spill or release will be provided to OCD for approval.

Re: Plains Pipeline Pitchfork Station Spill

Dear Stanley,

A records search was conducted on August 26, 2014 at the Bureau of Land Management Carlsbad Field Office for a spill which lies in T25S R34E Section 18. During the records search it was noted that the proposed project lies entirely within the boundaries of previous surveys, NMCRIS #'s 49530, 88532, 88307, 111217, 52606, 49003, 50183, 129811, and 49003. In consultation with BLM archaeologist Stacy Galassini, it was determined that no further survey is required. NOVA Safety and Environmental, Inc.'s project is recommended for approval as currently staked without further archaeological survey.

Legal Description: (NE ¼ NW ¼) of Section 18, T25S R34E in Lea County, New Mexico

Notes and Definitions

S-GC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
LCS	Laboratory Control Spike
MS	Matrix Spike
Dup	Duplicate

Report Approved By: Brent Barron Date: 9/30/2014

Notes and Definitions

QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
LCS	Laboratory Control Spike
MS	Matrix Spike
Dup	Duplicate

Report Approved By: Date: 10/20/2014

Notes and Definitions

QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
LCS	Laboratory Control Spike
MS	Matrix Spike
Dup	Duplicate

Report Approved By: Date: 10/20/2014

Brent Barron, Laboratory Director/Technical Director

Notes and Definitions

S-GC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
LCS	Laboratory Control Spike
MS	Matrix Spike
Dup	Duplicate

Report Approved By: Brent Barron Date: 10/28/2014

The results in this report apply to the samples analyzed in accordance with the samples received in the laboratory. This analytical report must be reproduced in its entirety, with written approval of Permian Basin Environmental Lab.

Notes and Definitions

S-GC	Surrogate recovery outside of control limits. The data was accepted based on valid recovery of the remaining surrogate.
QM-05	The spike recovery was outside acceptance limits for the MS and/or MSD due to matrix interference. The LCS and/or LCSD were within acceptance limits showing that the laboratory is in control and the data is acceptable.
DET	Analyte DETECTED
ND	Analyte NOT DETECTED at or above the reporting limit
NR	Not Reported
dry	Sample results reported on a dry weight basis
RPD	Relative Percent Difference
LCS	Laboratory Control Spike
MS	Matrix Spike
Dup	Duplicate

Narrative

Job Narrative
600-104781-1

Comments
No additional comments.

Receipt
The sample was received on 1/8/2015 10:45 AM; the sample arrived in good condition, properly preserved and, where required, on ice. The temperature of the cooler at receipt was 2.7º C.

GC/MS VOA
Method 8260B: The following sample was diluted due to the nature of the sample matrix: 5A07003-01 (600-104781-1). Elevated reporting limits (RLs) are provided.

Metals
Method 6010B: The leachate blank for batch 153455 contained Barium above the method detection limit. This target analyte concentration was less than the reporting limit (RL); therefore, re-extraction and/or re-analysis of samples was not performed.

General Chemistry
No analytical or quality issues were noted, other than those described in the Definitions/Glossary page.

Qualifiers

GC/MS VOA

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Metals

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.
B	Compound was found in the blank and sample.
J	Result is less than the RL but greater than or equal to the MDL and the concentration is an approximate value.

General Chemistry

Qualifier	Qualifier Description
U	Indicates the analyte was analyzed for but not detected.

Glossary

Abbreviation	These commonly used abbreviations may or may not be present in this report.
¤	Listed under the "D" column to designate that the result is reported on a dry weight basis
%R	Percent Recovery
CFL	Contains Free Liquid
CNF	Contains no Free Liquid
DER	Duplicate error ratio (normalized absolute difference)
Dil Fac	Dilution Factor
DL, RA, RE, IN	Indicates a Dilution, Re-analysis, Re-extraction, or additional Initial metals/anion analysis of the sample
DLC	Decision level concentration
MDA	Minimum detectable activity
EDL	Estimated Detection Limit
MDC	Minimum detectable concentration
MDL	Method Detection Limit
ML	Minimum Level (Dioxin)
NC	Not Calculated
ND	Not detected at the reporting limit (or MDL or EDL if shown)
PQL	Practical Quantitation Limit
QC	Quality Control
RER	Relative error ratio
RL	Reporting Limit or Requested Limit (Radiochemistry)
RPD	Relative Percent Difference, a measure of the relative difference between two points
TEF	Toxicity Equivalent Factor (Dioxin)
TEQ	Toxicity Equivalent Quotient (Dioxin)

Surrogate Summary

Question	Answer	Comment
Radioactivity wasn't checked or is </= background as measured by a survey meter.	N/A	Lab does not accept radioactive samples.
The cooler's custody seal, if present, is intact.	True	
Sample custody seals, if present, are intact.	True	
The cooler or samples do not appear to have been compromised or tampered with.	True	
Samples were received on ice.	True	
Cooler Temperature is acceptable.	True	
Cooler Temperature is recorded.	True	2.7
COC is present.	True	
COC is filled out in ink and legible.	True	
COC is filled out with all pertinent information.	True	
Is the Field Sampler's name present on COC?	True	
There are no discrepancies between the containers received and the COC.	True	
Samples are received within Holding Time.	True	
Sample containers have legible labels.	True	
Containers are not broken or leaking.	True	
Sample collection date/times are provided.	True	
Appropriate sample containers are used.	True	
Sample bottles are completely filled.	True	
Sample Preservation Verified.	True	
There is sufficient vol. for all requested analyses, incl. any requested MS/MSDs	True	
Containers requiring zero headspace have no headspace or bubble is <6mm (1/4").	True	
Multiphasic samples are not present.	True	
Samples do not require splitting or compositing.	True	
Residual Chlorine Checked.	N/A	Check done at department level as required.

Unit Letter	Section	Township	Range	Feet from the	North/South Line	Feet from the	East/West Line	County
C	18	25S	34E					Lea

Latitude N 32.13544° Longitude W 103.511972°

NATURE OF RELEASE

API# 30-025-12803

Type of Release Crude Oil	Volume of Release 150 bbls	Volume Recovered 110 bbls
Source of Release 8" Pipeline	Date and Hour of Occurrence 08/14/2014 @ 15:20	Date and Hour of Discovery 08/14/2014 @ 15:20
Was Immediate Notice Given? ☒ Yes ☐ No ☐ Not Required	If YES, To Whom? Verbal notification to Tomas Oberding	
By Whom? Camille Bryant	Date and Hour 08/15/2014 @ 14:00	
Was a Watercourse Reached? ☐ Yes ☒ No	If YES, Volume Impacting the Watercourse.	

If a Watercourse was Impacted, Describe Fully.*

Describe Cause of Problem and Remedial Action Taken.* Track hoe operator working for Plains struck a threaded fitting, breaking it causing a release of crude oil. The fitting was replaced.

Describe Area Affected and Cleanup Action Taken. The released crude oil impacted a surface area of approximately 18,000 square feet. The impacted area will be remediated as per applicable NMOCD guidelines.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.

NATURE OF RELEASE

Type of Release Crude Oil	Volume of Release 150 bbls	Volume Recovered 110 bbls
Source of Release 8" Pipeline	Date and Hour of Occurrence 08/14/2014 @ 15:20	Date and Hour of Discovery 08/14/2014 @ 15:20
Was Immediate Notice Given? ☒ Yes ☐ No ☐ Not Required	If YES, To Whom? Verbal notification to Tomas Oberding	
By Whom? Camille Bryant	Date and Hour 08/15/2014 @ 14:00	
Was a Watercourse Reached? ☐ Yes ☒ No	If YES, Volume Impacting the Watercourse.	

If a Watercourse was Impacted, Describe Fully.*

Describe Cause of Problem and Remedial Action Taken.* Track hoe operator working for Plains struck a threaded fitting, breaking it causing a release of crude oil. The fitting was replaced.

Describe Area Affected and Cleanup Action Taken. The released crude oil impacted a surface area of approximately 18,000 square feet. The impacted area was remediated per NMOCD recommended guidelines. Soil samples collected from the floor and sidewalls of the excavated areas were analyzed by an NMOCD approved laboratory, and concentrations of benzene, BTEX, TPH and chloride were below the recommended remediation action levels established for the site by the NMOCD. Please reference the attached *Site Closure Request* for complete remediation details.

I hereby certify that the information given above is true and complete to the best of my knowledge and understand that pursuant to NMOCD rules and regulations all operators are required to report and/or file certain release notifications and perform corrective actions for releases which may endanger public health or the environment. The acceptance of a C-141 report by the NMOCD marked as "Final Report" does not relieve the operator of liability should their operations have failed to adequately investigate and remediate contamination that pose a threat to ground water, surface water, human health or the environment. In addition, NMOCD acceptance of a C-141 report does not relieve the operator of responsibility for compliance with any other federal, state, or local laws and/or regulations.
