Re: Mark Owen #9 Reserve Pit (AP #57)
2013 Annual Groundwater Monitoring and Site Assessment Report

Dear Mr. Griswold,

On behalf of Chevron Environmental Management Company (CEMC), Conestoga-Rovers &Associates (CRA) has prepared the enclosed report *2013 Annual Groundwater Monitoring and Site Assessment Report* for the Mark Owen #9 Reserve Pit (AP #57) project. The enclosed document provides information regarding the results of assessment and monitoring activities completed at the site during calender year 2013. A comprehensive report detailing the results of groundwater monitoring and assessment activites completed in calendar year 2014 will be forthcoming soon.

CEMC appreciates your continued support of our efforts at the Mark Owen #9 site. Should you have any questions, please do not hesitate to contact me by phone at 713-372-7705 or via e-mail at kegan.boyer@chevron.com.

Sincerely,

Kegan W. Boyer, P.G.
Environmental Project Manager

Section 1.0 Project Information and Release Background

This Annual Groundwater Monitoring Report presents groundwater data collected during the 2013 reporting period at Mark Owen #9 Reserve Pit (Site). On March 19, June 6, September 12, and November 19, 2013, Conestoga-Rovers & Associates (CRA) conducted the quarterly groundwater monitoring events on behalf of Chevron Environmental Management Company (CEMC).

The legal description of the Site is the NW/4 of the SE/4 of Section 34, Township 21 South, Range 37 East, Lea County, New Mexico (**Figure 1**). The Site is situated immediately southeast of the town of Eunice, New Mexico and is associated with a release of fluids from the reserve pit used for the drilling of the Mark Owen #9 oil well by Chevron in 2006. Global Positioning System (GPS) coordinates for the site are latitude 32° 25' 56.49" north and longitude 103° 08' 46.27" west. The O-GRID number assigned to the Site is reported as #4323. The Mark Owen #9 well site is currently operated by Chevron USA. A Site details map is provided as **Figure 2**.

A Revised Stage 1 Abatement Plan (AP) for the Mark Owen #9 Reserve Pit was submitted on behalf of CEMC by CRA to the New Mexico Oil Conservation Division (NMOCD) in a correspondence dated March 13, 2007. The NMOCD assigned AP #57 to this Abatement Plan, however, the agency did not approve the March 2007 submittal. Consequently, CEMC performed additional investigation work in October 2007 in order to collect additional soil and groundwater data. An Interim Investigation Report was submitted to the agency in March 2008 summarizing the results of the October 2007 investigation. Reports for 2008, 2009, and 2010 were submitted by CRA to CEMC who in turn submitted the reports to the NMOCD in Santa Fe, New Mexico. Currently the Site is monitored quarterly. A revised AP has been submitted to the NMOCD. The scope of this AP has been verbally agreed to by the NMOCD and CEMC. Currently, public notifications have been completed and CEMC is waiting on final approval of the AP by the NMOCD.

Section 2.0 Regulatory Framework

The NMOCD guidelines require groundwater to be analyzed for constituents of concern (COC) as defined by the New Mexico Water Quality Control Commission (NMWQCC) regulations. The NMWQCC regulations provide Human Health Standards for Groundwater. The COC in affected groundwater at the Site is chloride. In this report, groundwater analytical results for chloride, TDS, BTEX, sulfates and total alkalinity are compared to the NMWQCC standards shown in the following table:

Analyte	NMWQCC Standard for Groundwater (mg/L)
Chloride[2]	250
Fluoride[1]	1.6
Nitrate (NO_3 as N)[1]	10
Sulfate (SO_4)[2]	600
Total Dissolved Solids (TDS)[2]	1,000
Benzene[1]	0.01
Toluene[1]	0.75
Ethylbenzene[1]	0.75
Total Xylenes[1]	0.62

Notes:
1) [1]NMWQCC Human Health Standards per NMAC 20.6.2.310B
2) [2]NMWQCC Other Standards for Domestic Water Supply per NMAC20.6.2.3103B

Section 3.0 Soil Boring and Monitor Well Plugging and Abandonment Activities

Prior to the initiation of soil boring or well plugging and abandonment activities on Site, work was performed to allow safe access to the former reserve pit. On October 23, 2013, RWI, under the supervision of CRA and Chevron, leveled the pit bottom and smoothed and sloped the pit side walls to a 1:1 slope. The work was completed under a Chevron approved Dig Plan and Excavation Permit.

Additional subsurface investigation work was performed at the Site during 2013. White Drilling of Clyde, Texas advanced three soil borings at the Site. Borings B-1, B-2, and B-3 were advanced at the site between November 19 and 20, 2013. Prior to mobilizing drilling equipment to the Site, the boring locations were marked and a New Mexico One Call utility locate ticket was completed at least 48-hours prior to mobilization. A Chevron Dig Plan and Excavation Permit were completed and approved by the Chevron, Eunice Field Management Team following the utility locate. Each boring location was pre-cleared by air knife prior to drilling. Borings were located within the Site's former reserve pit. The bottom of the former reserve pit is estimated at a depth of approximately 8 feet below ground surface (bgs). Soil boring B-1 was located in the northeast corner of the reserve pit, B-2 was located in the center of the reserve pit, and B-3 was located in the northwest corner of the reserve pit (**Figure 2**).

Borings were drilled using an air rotary drill rig. Sampling was performed using a 24-inch long, 2 inch diameter split spoon. Soil samples were collected in five foot intervals beginning at a depth of five feet below the pit bottom. Soil samples were collected for laboratory analysis.

Soil samples and drill cuttings were used for logging the soil type. Soil borings B-1, B-2, and B-3 were each advanced to a total depth of 21.5 feet below the pit floor. Groundwater was not encountered in any of the three borings and all borings were plugged using hydrated bentonite chips. Boring logs for B-1, B-2 and B-3 are included in **Appendix A**.

Also located within the former reserve pit at the Site was Temporary Monitor Well, TMW-3 (**Figure 2**). The temporary well was properly plugged and abandoned on November 19th, 2013 in accordance with the New Mexico Office of the State Engineer approved Plugging Plan of Action (**Appendix B**). The PVC well casing was cut off below grade and approximately six gallons of 95% Type I/II Portland cement and 5% bentonite was pumped from the bottom of well casing to ground surface.

3.1 Soil Analytical Results

Four soil samples were collected from each of the three soil borings (total of 12 samples) for laboratory analysis. Soil samples were collected in laboratory prepared containers, packed on ice, and sent under chain of custody documentation to Xenco Laboratories of Odessa, Texas. Soil samples were analyzed for chloride by Environmental Protection Agency (EPA) Method 300.0. A summary of soil analytical data has been included as **Table 1**.

Soil samples collected from B-1 indicated concentrations of chloride above the site specific NMOCD Recommended Remediation Action Level (RRAL) of 250mg/kg. Soil samples collected from soil borings B-2 and B-3 indicated chloride concentrations in soil below the 250 mg/kg RRAL. The corresponding laboratory analytical report has been included in **Appendix C**.

Section 4.0 Geophysical Surveys of Subsurface Soil

CRA completed a geophysical investigation at the Site located in Lea County, New Mexico, for CEMC between December 16 and 20, 2013. The purpose of the investigation was to assess the extent of suspected chloride-impacted areas in the subsurface. The geophysical investigation consisted of an electromagnetic (EM) survey and an electrical resistivity (ER) survey. An EM31 terrain conductivity meter (EM31) was used for the collection of conductivity measurements within the shallow subsurface, to an approximate depth of 17 feet below ground surface (bgs). Apparent resistivity measurements were collected along three ER survey lines to an approximate depth of 50 feet bgs, and these data were utilized to produce a 2-dimensional image of resistivity response in the subsurface beneath the Site.

4.1 Geophysical Survey Coverage

The geophysical survey coverage for both surveys is presented on **Figure 3**. The EM31 conductivity survey was completed over areas surrounding the former pit (where accessible), on survey lines spaced approximately 30 feet apart. The EM31 survey lines were oriented slightly east of a south to north trend. Topographic features such as access roads, perimeter and floor of the former reserve pit, pump jack compound and well pad were also surveyed for position control. The ER survey lines were completed to the west, east, and north of the former pit at line orientations as indicated on **Figure 3**.

4.2 Geophysical Survey Methods

The geophysical methods used for the investigation can be briefly described as follows. The EM31 consists of transmitter and receiver coils located at opposite ends of a 14-foot long boom. In vertical dipole mode (with the instrument held at hip level), this coil configuration yields an approximate depth of investigation of 17 feet bgs. The survey was conducted in metal detection mode, by logging the quadrature (Q) component of the induced secondary field. The secondary field Q component measures the conductivity of the shallow subsurface, and yields results in milliSiemens per meter (mS/m). The EM31 was used to determine the horizontal or lateral extent of suspected shallow chloride impacts, by delineating areas of elevated conductivity response. During the course of the survey, data were automatically stored in a Juniper Pro4000 data logger connected to a Leica GS-20 differential global positioning system (DGPS) receiver for position control. Both the EM31 survey data and DGPS points were collected at 1 second intervals. The DGPS locations are reported as New Mexico State Plane coordinates, North American Datum of 1983 (NAD83) Geodetic System.

The ER survey was completed using a Syscal R1 Plus receiver manufactured by Iris instruments, and a 72-electrode spread. The Syscal R1 Plus is a multi-electrode resistivity imaging system, with an internal switching board and a 200 Watt power source. The output current is automatically adjusted to optimize the input voltage values and ensure the best measurement quality. This system is designed to automatically survey pre-defined sets of resistivity measurements with roll-along capability.

Electrical resistivity profiles were completed along three sides of the former pit. Each survey setup utilized a 72-electrode spread configuration with 5-foot electrode spacings. A Wenner array was employed, whereby the two voltage electrodes were at the center of the profile and bound by the two current electrodes for each measurement. This array yielded a depth of investigation of approximately 50 feet bgs, along survey lines approximately 360 feet long.

Upon return from the Site, the ER survey and EM31 data were downloaded to a computer and compiled for data processing and plotting. The apparent resistivity data were imported into an inversion software program (RES2DINV), and processed to yield a modeled profile section of resistivity.

4.3 EM31 Conductivity Results

The EM31 data were processed as a colored contour plot, and superimposed over an aerial photograph outlining the surveyed area as presented on **Figure 4**. The highest intensity conductivity responses are colored red to purple, while areas of low response are colored blue. All remaining intermediate responses correspond to the color scale presented on the figure.

Review of the EM31 results reveals that the conductivity generally ranged from 5 to 50 mS/m, with the exception of the following. Several negative responses (contoured dark blue) were also observed, typically along linear trends in the southwest corner and along the northern boundary of the survey grid. These responses corresponded to locations where the EM31 survey crossed over metal pipes found on the ground surface. In locations where the survey was completed along the axis of a metal pipe the EM31 response was elevated, with peak values of approximately 70 mS/m. This result was observed in the northeast quadrant of the survey coverage, and is attributed to the pipe acting as an infinitely long conductor when the EM31 meter was oriented parallel to it.

Results from non-impacted areas including the survey coverage west of the former reserve pit indicate that the background conductivity responses typically ranged from 5 to 10 mS/m. Slightly anomalous responses were observed around the perimeter and within the floor of the former reserve pit. Peak responses up to 50 mS/m were observed at the top of slope in the north east corner of the former reserve pit. However, the elongated shape of this response suggests that this result is likely due to the presence of a buried metal object, such as a piece of metal pipe.

The slightly anomalous responses emanating from the former reserve pit appear to extend to the south and south east, beneath the pump jack compound and crushed aggregate pad to areas beyond the survey coverage. The direction of suspected chloride plume migration in the shallow subsurface is consistent with the flow of shallow groundwater beneath the Site. It must be noted that no anomalous responses in the shallow subsurface were observed immediately west and north of the reserve pit and that to the east, only slightly anomalous responses were observed.

Thus, the responses of suspected chloride-impacted areas associated with the former pit were only slightly anomalous and generally measured 3 to 5 times higher than background values. This is in comparison to CRA's experience with other former reserve pit investigations, where anomalous responses ten to twenty times higher than background are commonly measured.

4.4 Electrical Resistivity Survey Results

The locations of the electrical resistivity survey lines can be found on **Figure 3**. The modeled resistivity results are presented on **Figures 5** to **7**. As previously mentioned, these profiles were generated by processing the measured apparent resistivity data with the inversion program RES2DINV, to yield a modeled resistivity section for each line of the survey. The modeled sections represent the resistance of soils in the shallow subsurface, and thus provide an interpretation of the overburden sequences and areas of suspected chloride impacts along the lines of survey. Stratigraphic logs of nearby monitor wells have also been provided on the sections, to allow comparison between resistivity response and the various soil types encountered in the shallow subsurface.

The highest resistivity values on the modeled sections are colored dark blue, while areas of low resistivity (or conversely, high conductivity) are colored red to purple. All remaining intermediate responses correspond to the color scale presented at the bottom of the sections. Review of the colored plots reveals that contour intervals ranging from 17.5 to 1500 Ohm-m were applied. The plots also indicate that suspected chloride-impacted soils can be characterized by a measured resistivity response of approximately 17.5 to 40 Ohm-m.

The modeled resistivity sections indicate that the vertical distribution of suspected chloride impacts is variable for the three lines of survey. The results for each of the ER survey lines can be further described as follows.

Line 1 was located along the western boundary of the reserve pit and crushed aggregate service pad. This area is upgradient of the direction of shallow groundwater flow, and thus was expected to characterize background conditions and corresponding resistivity responses. Review of the modeled resistivity results presented on **Figure 5** indicates that the response from ground surface to approximately 15 feet bgs was dominated by elevated resistivity values in excess of 750 Ohm.m. This response was attributed to silty sands and caliche observed in the field, and confirmed by the stratigraphic log for well MW-3. Between 15 and 35 feet bgs, the resistivity response generally ranged from 250 to 750 Ohm.m, and reflected the presence of interbedded sand and sandstone. Beneath this depth interval, low resistivities of 40 to 150 Ohm.m indicated the presence of a clay sequence.

However, lower resistivity values of 17.5 to 40 Ohm.m were measured at depth at the north end of the survey line, adjacent to the former pit. These results suggest that chloride has likely impacted the sand layer overlying a clay sequence in this area.

Line 2 transected the crushed aggregate pad and continued along the eastern boundary of the former reserve pit. The modeled resistivity results for Line 2 presented on **Figure 6** indicate that suspected chloride impacts appear to extend from the shallow subsurface south of the pit to the deeper subsurface adjacent to the pit. Low resistivity values ranging from 17.5 to 40 Ohm.m were observed on surface east of the oil wellhead, and also across the deeper saturated zone at depths of 40 to 50 feet bgs. Based on the stratigraphic log for well MW-1, the chloride has impacted a sand sequence overlying a clay confining layer. Resistivity responses of 55 to 175 Ohm.m indicate that the upper saturated zone (20 to 40 feet bgs) has also been impacted by chloride. At the north end of the survey coverage, resistivity responses of 750 to 2000 Ohm.m reveal that no chloride impacts have occurred in the shallow subsurface.

The modeled resistivity results for Line 3 presented on **Figure 7** reveal that the shallow overburden between 15 to 20 feet bgs yielded resistivity values ranging from 750 to 3000 Ohm.m. These results indicate that the interbedded sand and caliche at these depths have not been impacted by chloride. However, the underlying saturated zone was characterized by responses of 17.5 to 100 Ohm.m, with the more conductive responses located at the base of the section where clay was encountered. The resistivity response between 20 to 50 feet bgs indicates that soils at this depth have been impacted by chloride which emanated from the former pit. Similar to the results observed for the other survey lines, the chloride impacts appear to occur in sandy sequences located above a clay confining layer.

4.5 Geophysical Survey Conclusions

Based on the results of the geophysical investigation presented herein, the following conclusions are presented:

- The EM31 conductivity results indicated areas of background response and the approximate limits of suspected chloride impacts, to a depth of approximately 17 feet bgs.
- The EM31 survey indicated that the conductivity responses beneath the former pit and downgradient area to the southeast was only slightly elevated, and generally measured 3 to 5 times higher than background values.
- With the exception of low resistivity values suggesting chloride impacts at depth adjacent to the former pit, the ER survey characterized background responses along Line 1 located to the west of the pit.

- The ER survey delineated the vertical extent of the suspected chloride impacts along Line 2 located adjacent to the oil wellhead and at depth along the eastern boundary of the former pit, where low resistivity responses indicative of chloride impacts were observed above a confining clay layer.
- To the north of the pit on survey Line 3, the ER survey confirmed the presence of un-impacted sand and caliche in the shallow subsurface and above the water table, and delineated chloride impacts in the saturated zone overlying the clay confining layer.

Section 5.0 Groundwater Monitoring Activities

The Site is monitored quarterly with a network of four monitor wells (MW-1, MW-2, MW-3, and MW-4) installed in October 2007, three wells (MW-5, MW-6, and MW-7) installed in September 2010 and three wells (MW-8, MW-9 and RW-1) installed in September 2011. Two monitor wells (MW-10 and MW-11) were installed in December 2012 and subsequently added to the quarterly schedule. Each well has an above-ground surface completion.

Monitor wells were sampled using disposable Hydrasleveeves™, a no purge, passive sampling method accepted by the EPA. Prior to sampling the monitor wells, a measurement of the static water level and a vertical conductivity profile were completed for each well using a Solinst® Temperature, Water Level, and Conductivity (TLC) meter. The static water level of each well was measured to the nearest hundredth of a foot. Conductivity profiles were completed by taking readings at approximately one foot intervals within the water column present in each well. Once water level and conductivity profile information was recorded, a Hydrasleeve™ was placed in the well and left undisturbed over night to allow the well to equilibrate prior to sampling. Within the 24 hours following placement of the Hydrasleeves™, samples were collected by removing the self-filling samplers from each well. Laboratory-supplied sample containers were filled directly from the Hydrasleeves™ and water quality parameters, including pH, temperature and conductivity, were recorded.

The groundwater samples were placed on ice in insulated coolers and chilled to a temperature of approximately 4 $^{\circ}$C (40 $^{\circ}$F). Samples were delivered to Xenco Laboratories of Odessa, Texas using EPA-approved chain-of-custody procedures. Water samples were analyzed for benzene, toluene, ethylbenzene and xylenes (BTEX) by EPA Method 8260B, total alkalinity (as $CaCO_3$) by SM2320B, chloride and sulfate by EPA Method 300/300.1, and total dissolved solids (TDS) by SM2540C.

Groundwater sampling activities did not generate purge water and disposal was not required.

5.1 Potentiometric Surface and Gradient

Groundwater elevation data are presented in **Table 2** and are consistent with elevations from the 2013 data. Groundwater gradient maps for March, June, September and November 2013 are presented as **Figures 8, 9, 10** and **11**, respectively. Groundwater elevations ranged from 3367.95 feet above mean sea level (amsl) to 3371.93 feet amsl on March 18, 2013, from 3367.73 feet to 3371.77 feet amsl on June 6, 2013, from 3367.50 feet to 3371.87 feet amsl on September 11, 2013, and from 3367.86 feet to 3371.87 feet amsl on November 19, 2013. Groundwater flow at the Site is to the southeast at a gradient of 0.0056-foot/foot. Potentiometric surface maps for each quarter of groundwater sampling in 2013 are included as **Figure 8** through **Figure 11**.

5.2 Analytical Results

The 2013 analytical results are summarized in **Table 3** and **Table 4**. Eleven monitor wells and one recovery well (MW-1 thru MW-11 and RW-1) were sampled during each quarterly event. Site monitor wells exceeded chloride and TDS NMWQCC standards during the quarterly monitoring events except for MW-2 in March and September 2013, and MW-3 and MW-4 during the four 2013 quarterly events. Monitor Well MW-8 was the only well to exceed the sulfate NMWQCC standard. Although concentrations of sulfate in samples collected from MW-8 exceed the NMWQCC standard, it is unlikely that this is a result of the reserve pit release since monitor wells upgradient of MW-8 with higher concentrations of chlorides and TDS have lower concentrations of sulfate. The elevated level of sulfate in MW-8 might reflect naturally occurring conditions or could have the potential to be associated with off-Site operations. Constituents of BTEX were below NMWQCC standards in all groundwater samples collected in 2013. Isopleth maps approximating chloride and TDS concentration contours for the March, June, September and November 2013 events are shown on **Figures 12** through **19**.

Groundwater COCs detected above the NMWQCC "Other Standards for Domestic Water Supply" are shaded in **Table 4**.

A duplicate sample was collected from MW-9 during the March 2013 monitoring event, from RW-1 in June 2013, from MW-7 in September 2013, and from MW-5 in November 2013. Duplicate constituents were detected without any significant deviations during the March, June, and September monitoring events. Constituents detected in the duplicate collected from MW-5 during the November 2013 event deviated significantly for sulfate, chloride and TDS. Copies of the certified analytical reports and chain-of-custody documentation are attached in **Appendix D**.

Section 6.0 Summary of Findings

Based on groundwater assessment activities performed by CRA at the Site in March, June, September and November, 2013, the summaries of findings include the following:

- Groundwater elevations ranged from 3367.95-feet to 3371.93-feet on March 18, 2013, from 3367.73-feet to 3371.77-feet on June 6, 2013, from 3367.50-feet to 3371.87-feet on September 11, 2013, and from 3367.86-feet to 3371.87-feet above mean sea level on November 19, 2013. Groundwater flow at the Site is to the southeast at a gradient of 0.0056-ft/ft.
- Site monitor wells exceeded chloride and TDS NMWQCC standards during the quarterly monitoring events except for MW-2 in March and September 2013, and MW-3 and MW-4 during all four 2013 quarterly events.
- Sulfate was detected at concentrations above the NMWQCC standard in MW-8 during all four quarterly monitoring events in 2013;
- The chloride plume is not delineated to the south or east of current site monitor wells.

Section 7.0 Recommendations

Based upon the summary of findings presented in this report, the following is recommended:

- Delineate groundwater impacts to the east and south of the reserve pit;
- Subsequent to the delineation of the plume, CRA will evaluate remedial alternatives to address the chloride impacted groundwater.
- Continue quarterly groundwater monitoring in 2014 to monitor the chloride, TDS, and sulfate levels in site monitor wells.

Respectfully Submitted,

Chevron Environmental Management Company

NOTES:

1. SOIL BORING, FENCE AND MONITOR WELL LOCATIONS SURVEYED BY WEST AND COMPANY DECEMBER 3, 2007 AND OCTOBER 8, 2010
2. MW-5, MW-6, AND MW-7 WERE INSTALLED IN SEPTEMBER 2010
3. MW-8, MW-9, AND RW-1 WERE INSTALLED IN SEPTEMBER 2011
4. MW-10 AND MW-11 WERE INSTALLED IN DECEMBER 2012
5. WELLS WERE GAUGED NOVEMBER 19, 2013.

Notes:

1) Highlighted concentrations above lab reporting limits.
2) BTEX analysis by EPA Method 8021B
3) TPH (GRO/DRO) analysis by EPA Method 8015 Modified.
4) Results shown in mg/L.
5) J = estimated value between RL & MDL
6) DUP = Duplicate sample

RE: Well Plugging Plan of Operations for unidentified monitoring well Chevron Mark Owen Site, Eunice, New Mexico

Greetings:

Enclosed is your copy of the Well Plugging Plan of Operations for the above referenced project. The proposed method of operation is found to be acceptable and in accordance with the Rules and Regulations Governing Well Driller Licensing; Construction, Repair and Plugging of Wells 19.27.4 NMAC adopted August 31, 2005 by the State Engineer.

Sincerely,

Catherine (Cath) Goetz
Water Resource Specialist
District II Office of the State Engineer

Enclosure

WELL PLUGGING PLAN OF OPERATIONS

NOTE: A Well Plugging Plan of Operations shall be filed with and accepted by the Office of the State Engineer prior to plugging.

I. FILING FEE: There is no filing fee for this form.

II. GENERAL / WELL OWNERSHIP:

Existing Office of the State Engineer POD Number (Well Number) for well to be plugged: Not permitted. Mark Owen site well TMW-3

Name of well owner: Chevron

Mailing address: P.O. Box 1949

City: Eunice State: NM Zip code: 88231

Phone number: 713-372-7705 E-mail: kegan.boyer@chevron.com

III. WELL DRILLER INFORMATION:

Well Driller contracted to provide plugging services: White Drilling Company, Inc.

New Mexico Well Driller License No.: WD-1456 Expiration Date: 9/30/2014

IV. WELL INFORMATION:

Note: A copy of the existing Well Record for the well to be plugged should be attached to this plan.

STATE ENGINEER OFFICE
POST... 2013 NOV 15 P 2:21

1) GPS Well Location: Latitude: 32 deg, 25 min, 59 N sec
Longitude: 103 deg, 08 min, 49 W sec, NAD 83

2) Reason(s) for plugging well: Well initially installed as a temporary monitoring well within a reserve pit and is no longer needed

3) Was well used for any type of monitoring program? Yes If yes, please use section VII of this form to detail what hydrogeologic parameters were monitored. If the well was used to monitor contaminated or poor quality water, authorization from the New Mexico Environment Department may be required prior to plugging.

4) Does the well tap brackish, saline, or otherwise poor quality water? Yes If yes, provide additional detail, including analytical results and/or laboratory report(s): Groundwater from this well initially indicated a chloride concentration of 9,697 mg/L in 2006

5) Static water level: Approximately 30 (feet below land surface) / feet above land surface (circle one)

6) Depth of the well: Approximately 30 below bottom surface of reserve pit which is approximately 8 feet bgs

7) Inside diameter of innermost casing: 2 inches.

8) Casing material: PVC

9) The well was constructed with:

_____ an open-hole production interval, state the open interval: _____

X a well screen or perforated pipe, state the screened interval(s): 18 to 30 feet bgs

10) What annular interval surrounding the artesian casing of this well is cement-grouted? N/A

11) Was the well built with surface casing? No If yes, is the annulus surrounding the surface casing grouted or otherwise sealed? _____ If yes, please describe: _____

12) Has all pumping equipment and associated piping been removed from the well? N/A If not, describe remaining equipment and intentions to remove prior to plugging in Section VII of this form.

V. DESCRIPTION OF PLANNED WELL PLUGGING:

Note: If this plan proposes to plug an artesian well in a way other than with cement grout, placed bottom to top with a tremie pipe, a detailed diagram of the well showing proposed final plugged configuration shall be attached, as well as any additional technical information, such as geophysical logs, that are necessary to adequately describe the proposal.

1) Describe the method by which cement grout shall be placed in the well, or describe requested plugging methodology proposed for the well: Well will be grouted from total depth of well to land surface by means of a tremie pipe. Grout will be neat cement consisting of Portland Type I/II and 3 to 5% bentonite. Bentonite will be pre hydrated prior to adding Portland. Well casing will be cut off a minimum of six inches below grade and land surfaced restored to its current elevation.

2) Will well head be cut-off below land surface after plugging? Yes

VI. PLUGGING AND SEALING MATERIALS:

Note: The plugging of a well that taps poor quality water may require the use of a specialty cement or specialty sealant.

1) For plugging intervals that employ cement grout, complete and attach Table A.

2) For plugging intervals that will employ approved non-cement based sealant(s), complete and attach Table B.

3) Theoretical volume of grout required to plug the well to land surface: 4.8 gallons

4) Type of Cement proposed: Portland Type I/II with 3 to 5% bentonite

5) Proposed cement grout mix: 6.0 gallons of water per 94 pound sack of Portland cement.

6) Will the grout be: _____ batch-mixed and delivered to the site

X mixed on site

STATE ENGINEER OFFICE
2013 NOV 14 A 9:21

7) Grout additives requested, and percent by dry weight relative to cement: Bentonite at 3 – 5%

8) Additional notes and calculations:

VII. ADDITIONAL INFORMATION: List additional information below, or on separate sheet(s):

VIII. SIGNATURE:

I, John W. White, say that I have carefully read the foregoing Well Plugging Plan of Operations and any attachments, which are a part hereof; that I am familiar with the rules and regulations of the State Engineer pertaining to the plugging of wells and will comply with them, and that each and all of the statements in the Well Plugging Plan of Operations and attachments are true to the best of my knowledge and belief.

Signature of Applicant — Date: 11/14/13

IX. ACTION OF THE STATE ENGINEER:

This Well Plugging Plan of Operations is:

X Approved subject to the attached conditions.
_____ Not approved for the reasons provided on the attached letter.

Witness my hand and official seal this 15th day of November, 2013

Scott A. Verhines, State Engineer

By: C. Goetz
For Andy Morley
District II Supervisor

STATE ENGINEER OFFICE
ROSWELL, NEW MEXICO
2013 NOV 15 A 9:21

Conditions of Approval for Chevron Mark Owen Site Well Plugging Plan for TMW-3: 11/15/13

1) Per our email correspondence on 11/08/13, the Well Record indicates a bentonite and cement annular seal surrounding the subject well. Therefore, plugging the well in place will be acceptable for OSE regulations. The Well Record has been attached to the Plugging Plan for reference.

2) Plugging operations will be conducted in accordance with NMED, NMOCD, or other State or Federal agency having oversight for the above described project.

TABLE A - For plugging intervals that employ cement grout. Start with deepest interval.

	Interval 1 – deepest	Interval 2	Interval 3 – most shallow
			Note: if the well is non-artesian and breaches only one aquifer, use only this column.
Top of proposed interval of grout placement (ft bgl)			0 feet bgl
Bottom of proposed interval of grout placement (ft bgl)			30 feet bgl
Theoretical volume of grout required per interval (gallons)			4.8 gallons
Proposed cement grout mix gallons of water per 94-lb. sack of Portland cement			6.0 gallons
Mixed on-site or batch-mixed and delivered?			On-site
Grout additive 1 requested			bentonite
Additive 1 percent by dry weight relative to cement			3 to 5 %
Grout additive 2 requested			
Additive 2 percent by dry weight relative to cement			

TABLE B - For plugging intervals that will employ approved non-cement based sealant(s). Start with deepest interval.

	Interval 1 – deepest	Interval 2	Interval 3 – most shallow
			Note: if the well is non-artesian and breaches only one aquifer, use only this column.
Top of proposed interval of sealant placement (ft bgl)			
Bottom of proposed sealant of grout placement (ft bgl)			
Theoretical volume of sealant required per interval (gallons)			
Proposed abandonment sealant (manufacturer and trade name)

Bernie Bockisch:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 474457. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 474457 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Kelsey Brooks

Batch: LBA-928559 Inorganic Anions by EPA 300/300.1
E300

Batch 928559, Chloride recovered above QC limits in the Matrix Spike.
Samples affected are: 474457-002, -007, -011, -013, -008, -009, -004, -005, -006, -001, -003, -010, -012.
The Laboratory Control Sample for Chloride is within laboratory Control Limits

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the quantitation limit and above the detection limit.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

** Surrogate recovered outside laboratory control limit.

BRL Below Reporting Limit.

RL Reporting Limit

MDL Method Detection Limit **SDL** Sample Detection Limit **LOD** Limit of Detection

Brittany Ford:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 459560. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 459560 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Nicholas Straccione
Project Manager

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the quantiation limit and above the detection limit.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

* Surrogate recovered outside laboratory control limit.

BRL Below Reporting Limit.

RL Reporting Limit

MDL Method Detection Limit **SDL** Sample Detection Limit **LOD** Limit of Detection

PQL Practical Quantitation Limit **MQL** Method Quantitation Limit **LOQ** Limit of Quantitation

DL Method Detection Limit

NC Non-Calculable

\+ NELAC certification not offered for this compound.

***** (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

Sample Receipt Checklist	Comments
#1 *Temperature of cooler(s)?	18
#2 *Shipping container in good condition?	**Yes**
#3 *Samples received on ice?	**Yes**
#4 *Custody Seals intact on shipping container/ cooler?	**Yes**
#5 Custody Seals intact on sample bottles?	**Yes**
#6 *Custody Seals Signed and dated?	**Yes**
#7 *Chain of Custody present?	**Yes**
#8 Sample instructions complete on Chain of Custody?	**Yes**
#9 Any missing/extra samples?	**No**
#10 Chain of Custody signed when relinquished/ received?	**Yes**
#11 Chain of Custody agrees with sample label(s)?	**Yes**
#12 Container label(s) legible and intact?	**Yes**
#13 Sample matrix/ properties agree with Chain of Custody?	**Yes**
#14 Samples in proper container/ bottle?	**Yes**
#15 Samples properly preserved?	**Yes**
#16 Sample container(s) intact?	**Yes**
#17 Sufficient sample amount for indicated test(s)?	**Yes**
#18 All samples received within hold time?	**Yes**
#19 Subcontract of sample(s)?	**Yes**
#20 VOC samples have zero headspace (less than 1/4 inch bubble)?	**Yes**
#21 <2 for all samples preserved with HNO3,HCL, H2SO4?	**Yes**
#22 >10 for all samples preserved with NaAsO2+NaOH, ZnAc+NaOH?	**Yes**

*** Must be completed for after-hours delivery of samples prior to placing in the refrigerator**

Project Address: Eunice NM

Bernie Bockisch:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 464702. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 464702 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Kelsey Brooks
Project Manager

This laboratory is NELAC accredited under the Texas Laboratory Accreditation Program for all the methods, analytes, and matrices reported in this data package except as noted. The data have been reviewed and are technically compliant with the requirements of the methods used, except where noted by the laboratory.

Sample receipt non conformances and comments:

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-915843 Inorganic Anions by EPA 300/300.1
E300

Batch 915843, Sulfate recovered below QC limits in the Matrix Spike. Chloride recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate.
Samples affected are: 464702-002, -001.
The Laboratory Control Sample for Chloride , Sulfate is within laboratory Control Limits

Batch: LBA-915845 Inorganic Anions by EPA 300/300.1
E300

Batch 915845, Chloride recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate. Sulfate recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate.
Samples affected are: 464702-010, -007, -006, -008, -009, -005, -011, -012, -004, -013, -003.
The Laboratory Control Sample for Chloride , Sulfate is within laboratory Control Limits

Batch: LBA-915939 Inorganic Anions by EPA 300/300.1
E300

Batch 915939, Chloride recovered below QC limits in the Matrix Spike and Matrix Spike Duplicate.
Samples affected are: 464702-010, -009, -013.
The Laboratory Control Sample for Chloride is within laboratory Control Limits

Batch: LBA-916172 BTEX by EPA 8021B
SW8021BM

Batch 916172, Toluene recovered below QC limits in the Matrix Spike.
Samples affected are: 464702-013.
The Laboratory Control Sample for Toluene is within laboratory Control Limits

Project Manager

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the quantiation limit and above the detection limit.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

* Surrogate recovered outside laboratory control limit.

BRL Below Reporting Limit.

RL Reporting Limit

MDL Method Detection Limit **SDL** Sample Detection Limit **LOD** Limit of Detection

PQL Practical Quantitation Limit **MQL** Method Quantitation Limit **LOQ** Limit of Quantitation

DL Method Detection Limit

NC Non-Calculable

\+ NELAC certification not offered for this compound.

***** (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

Project Address: Eunice, New Mexico

Bernie Bockisch:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 470218. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 470218 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Kelsey Brooks
Project Manager

Sample receipt non conformances and comments per sample:

None

Analytical non conformances and comments:

Batch: LBA-922959 BTEX by SW 8260B
SW8260BTX

Batch 922959, Benzene recovered above QC limits in the Matrix Spike and Matrix Spike Duplicate.
Samples affected are: 470218-011, -001, -003, -005, -008, -007, -013, -004, -006, -009, -010, -002.
The Laboratory Control Sample for Benzene is within laboratory Control Limits

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the quantiation limit and above the detection limit.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

** Surrogate recovered outside laboratory control limit.

BRL Below Reporting Limit.

RL Reporting Limit

MDL Method Detection Limit **SDL** Sample Detection Limit **LOD** Limit of Detection

PQL Practical Quantitation Limit **MQL** Method Quantitation Limit **LOQ** Limit of Quantitation

DL Method Detection Limit

NC Non-Calculable

+ NELAC certification not offered for this compound.

***** (Next to analyte name or method description) = Outside XENCO's scope of NELAC accreditation

Prelogin/Nonconformance Report- Sample Log-In

Client: Conestoga-Rovers & Associates-Albuqu

Date/ Time Received: 09/12/2013 04:45:00 PM

Work Order #: 470218

Acceptable Temperature Range: 0 - 6 degC
Air and Metal samples Acceptable Range: Ambient

Temperature Measuring device used :

Sample Receipt Checklist	Comments
#1 *Temperature of cooler(s)?	4
#2 *Shipping container in good condition?	**Yes**
#3 *Samples received on ice?	**Yes**
#4 *Custody Seals intact on shipping container/ cooler?	**N/A**
#5 Custody Seals intact on sample bottles?	**N/A**
#6 *Custody Seals Signed and dated?	**N/A**
#7 *Chain of Custody present?	**Yes**
#8 Sample instructions complete on Chain of Custody?	**Yes**
#9 Any missing/extra samples?	**No**
#10 Chain of Custody signed when relinquished/ received?	**Yes**
#11 Chain of Custody agrees with sample label(s)?	**Yes**
#12 Container label(s) legible and intact?	**Yes**
#13 Sample matrix/ properties agree with Chain of Custody?	**Yes**
#14 Samples in proper container/ bottle?	**Yes**
#15 Samples properly preserved?	**Yes**
#16 Sample container(s) intact?	**Yes**
#17 Sufficient sample amount for indicated test(s)?	**Yes**
#18 All samples received within hold time?	**Yes**
#19 Subcontract of sample(s)?	**Yes**
#20 VOC samples have zero headspace (less than 1/4 inch bubble)?	**Yes**
#21 <2 for all samples preserved with HNO3,HCL, H2SO4?	**Yes**
#22 >10 for all samples preserved with NaAsO2+NaOH, ZnAc+NaOH?	**N/A**

*** Must be completed for after-hours delivery of samples prior to placing in the refrigerator**

Bernie Bockisch:

We are reporting to you the results of the analyses performed on the samples received under the project name referenced above and identified with the XENCO Report Number(s) 474413. All results being reported under this Report Number apply to the samples analyzed and properly identified with a Laboratory ID number. Subcontracted analyses are identified in this report with either the NELAC certification number of the subcontract lab in the analyst ID field, or the complete subcontracted report attached to this report.

Unless otherwise noted in a Case Narrative, all data reported in this Analytical Report are in compliance with NELAC standards. The uncertainty of measurement associated with the results of analysis reported is available upon request. Should insufficient sample be provided to the laboratory to meet the method and NELAC Matrix Duplicate and Matrix Spike requirements, then the data will be analyzed, evaluated and reported using all other available quality control measures.

The validity and integrity of this report will remain intact as long as it is accompanied by this letter and reproduced in full, unless written approval is granted by XENCO Laboratories. This report will be filed for at least 5 years in our archives after which time it will be destroyed without further notice, unless otherwise arranged with you. The samples received, and described as recorded in Report No. 474413 will be filed for 60 days, and after that time they will be properly disposed without further notice, unless otherwise arranged with you. We reserve the right to return to you any unused samples, extracts or solutions related to them if we consider so necessary (e.g., samples identified as hazardous waste, sample sizes exceeding analytical standard practices, controlled substances under regulated protocols, etc).

We thank you for selecting XENCO Laboratories to serve your analytical needs. If you have any questions concerning this report, please feel free to contact us at any time.

Respectfully,

Kelsey Brooks
Project Manager

None

Analytical non conformances and comments:

Batch: LBA-928282 Inorganic Anions by EPA 300/300.1
E300

Batch 928282, Chloride recovered above QC limits
Samples affected are: 474413-004, -011, -003, -005, -012, -006, -007, -008, -009, -001, -010, -002, -013.
The Laboratory Control Sample for Chloride is within laboratory Control Limits

Batch: LBA-928602 BTEX by EPA 8021B
SW8021BM

Batch 928602, m,p-Xylenes RPD was outside laboratory control limits.
Samples affected are: 474413-009, -010

SW8021BM

Batch 928602, Ethylbenzene recovered below QC limits in the laboratory control sample.
Samples affected are: 474413-009, -010.

Flagging Criteria

X In our quality control review of the data a QC deficiency was observed and flagged as noted. MS/MSD recoveries were found to be outside of the laboratory control limits due to possible matrix /chemical interference, or a concentration of target analyte high enough to affect the recovery of the spike concentration. This condition could also affect the relative percent difference in the MS/MSD.

B A target analyte or common laboratory contaminant was identified in the method blank. Its presence indicates possible field or laboratory contamination.

D The sample(s) were diluted due to targets detected over the highest point of the calibration curve, or due to matrix interference. Dilution factors are included in the final results. The result is from a diluted sample.

E The data exceeds the upper calibration limit; therefore, the concentration is reported as estimated.

F RPD exceeded lab control limits.

J The target analyte was positively identified below the quantitation limit and above the detection limit.

U Analyte was not detected.

L The LCS data for this analytical batch was reported below the laboratory control limits for this analyte. The department supervisor and QA Director reviewed data. The samples were either reanalyzed or flagged as estimated concentrations.

H The LCS data for this analytical batch was reported above the laboratory control limits. Supporting QC Data were reviewed by the Department Supervisor and QA Director. Data were determined to be valid for reporting.

K Sample analyzed outside of recommended hold time.

JN A combination of the "N" and the "J" qualifier. The analysis indicates that the analyte is "tentatively identified" and the associated numerical value may not be consistent with the amount actually present in the environmental sample.

** Surrogate recovered outside laboratory control limit.

BRL Below Reporting Limit.

RL Reporting Limit

MDL Method Detection Limit **SDL** Sample Detection Limit **LOD** Limit of Detection

Sample Receipt Checklist	Comments
#1 *Temperature of cooler(s)?	.5
#2 *Shipping container in good condition?	**Yes**
#3 *Samples received on ice?	**Yes**
#4 *Custody Seals intact on shipping container/ cooler?	**N/A**
#5 Custody Seals intact on sample bottles?	**N/A**
#6 *Custody Seals Signed and dated?	**N/A**
#7 *Chain of Custody present?	**Yes**
#8 Sample instructions complete on Chain of Custody?	**Yes**
#9 Any missing/extra samples?	**No**
#10 Chain of Custody signed when relinquished/ received?	**Yes**
#11 Chain of Custody agrees with sample label(s)?	**Yes**
#12 Container label(s) legible and intact?	**Yes**
#13 Sample matrix/ properties agree with Chain of Custody?	**Yes**
#14 Samples in proper container/ bottle?	**Yes**
#15 Samples properly preserved?	**Yes**
#16 Sample container(s) intact?	**Yes**
#17 Sufficient sample amount for indicated test(s)?	**Yes**
#18 All samples received within hold time?	**Yes**
#19 Subcontract of sample(s)?	**Yes**
#20 VOC samples have zero headspace (less than 1/4 inch bubble)?	**Yes**
#21 <2 for all samples preserved with HNO3,HCL, H2SO4?	**Yes**
#22 >10 for all samples preserved with NaAsO2+NaOH, ZnAc+NaOH?	**N/A**

*** Must be completed for after-hours delivery of samples prior to placing in the refrigerator**
