Re: Giant Bloomfield Refinery – River Terrace Sheet Pile Area

Dear Mr. Price:

As a follow up to our letter dated October 27, 2004, Giant is submitting this letter report summarizing the field investigation performed in the river terrace sheet-pile area at the Bloomfield facility.

The purpose of the investigation was to 1) install two new monitoring wells at the river terrace to supplement the two existing piezometers currently used for water quality monitoring and 2) evaluate the presence and extent of fuel hydrocarbons in groundwater on the refinery side of the sheet-pile barrier. The investigation resulted from Giant's meeting with NMOCD in Santa Fe, New Mexico on October 18, 2004.

Field Investigation Activities

The investigation involved the installation of eight temporary well points (TP-1 through TP-8) and two permanent wells (MW-48 and MW-49). Precision Engineering from Las Cruces, New Mexico installed the well points and monitoring wells on October 27 and October 28, 2004 using a hollow-stem auger drill rig. The location of the eight well points and the two wells are shown on Figure 1. Logs of the well points and monitoring wells are attached in Appendix A.

The well points were constructed using two-inch diameter hand-slotted PVC casing placed approximately five feet below the water table. The two monitoring wells were constructed with four-inch diameter PVC well casing and ten feet of 0.020-inch machine slotted screen. All the well screens intersect the water table.

Soil samples were collected from Wells MW-48 and MW-49 and were submitted to Hall Environmental Analysis Laboratory for analysis for the following parameters:

- Total Petroleum Hydrocarbons - Diesel and Motor Oil Range Organics (DRO & MRO) by EPA Modified Method 8015B,
- Total Petroleum Hydrocarbons - Gasoline Range Organics (GRO) by EPA Modified Method 8015B, and
- Volatile Organic Compounds by EPA Method 8260B.

Following the installation and development of the well points and wells, Giant collected groundwater samples from them on October 28 and November 1, 2004. The samples were submitted to Hall Environmental Analysis Laboratory for analysis. Groundwater samples collected from the temporary well points were analyzed for the following parameters:

- Total Petroleum Hydrocarbons - Diesel and Motor Oil Range Organics (DRO & MRO) by EPA Modified Method 8015B
- Total Petroleum Hydrocarbons - Gasoline Range Organics (GRO) by EPA Modified Method 8015B
- Volatile Organic Compounds by EPA Method 8021B

Groundwater samples collected from MW-48 and MW-49 were analyzed for the following parameters:

- Total Petroleum Hydrocarbons - Diesel and Motor Oil Range Organics (DRO & MRO) by EPA Modified Method 8015B
- Total Petroleum Hydrocarbons - Gasoline Range Organics (GRO) by EPA Modified Method 8015B
- Volatile Organic Compounds by EPA Method 8260B
- Anions (Fluoride, Chloride, Nitrite, Nitrate, Phosphorus, Sulfate) by EPA Method 300.0
- Polynuclear Aromatic Hydrocarbons by EPA Method 8310
- Specific Conductance by EPA Method 120.1
- Mercury by EPA Method 7470
- Dissolved Metals by EPA Method 6010C
- Total Recoverable Metals by EPA Method 6010C
- pH by EPA Method 150.1
- Total Dissolved Solids by EPA Method 160.1

A summary of the fuel hydrocarbon results from each well are presented on Figure 2. All soil and groundwater analytical results obtained from this investigation are presented in Table 1.

Preliminary Data Review

On the refinery side of the sheet-pile barrier, the groundwater sampling results indicate fuel hydrocarbon contamination extends from the barrier to the east to temporary well point TP-4. Fuel hydrocarbons were also reported in well point TP-3, the farthest east well point. but the concentrations were low compared to the results closer to the barrier. For example, benzene was detected in TP-3, but the concentration was below 5 ug/L. The highest BTEX concentrations were reported near the barrier in TP-1, TP-8, and MW-48.

Comparing the groundwater sampling results from well MW-49 (river side of barrier) to those from MW-48, fuel hydrocarbons were reported to be significantly lower on the river side of the barrier. For example, the benzene and toluene concentrations in MW-49 were reported below the laboratory detection limit of 10 ug/L. Ethylbenzene and xylenes were detected, but were reported at concentrations approximately two orders of magnitude less than reported in well MW-48. These data indicate the sheet-pile wall is acting as a significant barrier against fuel hydrocarbon migration to the river.

Low concentrations of diesel and gasoline-range organics were reported in the soil samples taken from monitoring wells MW-48 and MW-49. The depth of occurrence appears to be similar in both locations, suggesting the existence of these hydrocarbons in the soil predates the barrier installation. The concentrations reported in the soil samples from MW-49 (river side of barrier) are generally one-half those reported from MW-48.

Proposed Additional Activities

Based on the results of this investigation, we recommend the following activities:

1) Conduct a 24-hour aquifer test on well MW-48 to evaluate aquifer properties. Monitor drawdown in the monitoring wells MW-48 and MW-49, and selected well points surrounding MW-48. Collect groundwater samples in MW-48 and MW-49 during the test.
2) Complete a capture zone analysis and estimate the number of extraction wells and related pumping rates that would be needed to control the impacted groundwater on the refinery side of the barrier and further mitigate migration of hydrocarbons to the San Juan River. The effectiveness of implementing a pumping approach will then be evaluated as part of a feasibility study of alternatives.
3) It appears the extent of groundwater impacts has not been fully delineated along the San Juan River upstream of the barrier and east of TP-3. As such, install additional temporary well points in these locations
4) Sample wells MW-48 and MW-49 on a monthly schedule to evaluate water quality trends. The wells will be sampled for TPH (GRO), BTEX, and PAHs.
5) Conduct a feasibility study to evaluate alternatives for reducing fuel hydrocarbon concentrations in the shallow aquifer beneath the river terrace.
6) Submit the feasibility study to NMOCD for approval.

Preliminary Data Review

On the refinery side of the sheet-pile barrier, the groundwater sampling results indicate fuel hydrocarbon contamination extends from the barrier to the east to temporary well point TP-4. Fuel hydrocarbons were also reported in well point TP-3, the farthest east well point, but the concentrations were low compared to the results closer to the barrier. For example, benzene was detected in TP-3, but the concentration was below 5 ug/L. The highest BTEX concentrations were reported near the barrier in TP-1, TP-8, and MW-48.

Comparing the groundwater sampling results from well MW-49 (river side of barrier) to those from MW-48, fuel hydrocarbons were reported to be significantly lower on the river side of the barrier. For example, the benzene and toluene concentrations in MW-49 were reported below the laboratory detection limit of 10 ug/L. Ethylbenzene and xylenes were detected, but were reported at concentrations approximately two orders of magnitude less than reported in well MW-48. These data indicate the sheet-pile wall is acting as a significant barrier against fuel hydrocarbon migration to the river.

Low concentrations of diesel and gasoline-range organics were reported in the soil samples taken from monitoring wells MW-48 and MW-49. The depth of occurrence appears to be similar in both locations, suggesting the existence of these hydrocarbons in the soil predates the barrier installation. The concentrations reported in the soil samples from MW-49 (river side of barrier) are generally one-half those reported from MW-48.

Proposed Additional Activities

Based on the results of this investigation, we recommend the following activities:

1) Conduct a 24-hour aquifer test on well MW-48 to evaluate aquifer properties. Monitor drawdown in the monitoring wells MW-48 and MW-49, and selected well points surrounding MW-48. Collect groundwater samples in MW-48 and MW-49 during the test.
2) Complete a capture zone analysis and estimate the number of extraction wells and related pumping rates that would be needed to control the impacted groundwater on the refinery side of the barrier and further mitigate migration of hydrocarbons to the San Juan River. The effectiveness of implementing a pumping approach will then be evaluated as part of a feasibility study of alternatives.
3) It appears the extent of groundwater impacts has not been fully delineated along the San Juan River upstream of the barrier and east of TP-3. As such, install additional temporary well points in these locations
4) Sample wells MW-48 and MW-49 on a monthly schedule to evaluate water quality trends. The wells will be sampled for TPH (GRO), BTEX, and PAHs.
5) Conduct a feasibility study to evaluate alternatives for reducing fuel hydrocarbon concentrations in the shallow aquifer beneath the river terrace.
6) Submit the feasibility study to NMOCD for approval.

Giant anticipates the aquifer test will be performed in early December 2004. Following analysis of the data obtained, the feasibility study will be conducted to identify an approach to reduce the concentrations of fuel hydrocarbons on the refinery side of the barrier and further mitigate fuel hydrocarbon migration to the river. Giant anticipates submitting a feasibility study report, which will include the aquifer test results, to NMOCD by mid-January 2005. Installation of the additional temporary well points will occur in parallel with the feasibility study, and the results of that work will be reported to NMOCD within two weeks of receiving laboratory results.

If you have any questions in this matter, please contact me at 505-632-4171.

Sincerely,

GIANT REFINING COMPANY
