RE: Groundwater Remediation

Dear Mr. Boyer:

Please be advised that we put four more groundwater recovery wells into service on October 28, 1991. These are identified as RW-14, RW-15, RW-16, and RW-17. Wells RW-2, RW-3, and RW-19 continue in service, bringing our total to seven. We are now proceeding with the pump installation at RW-18.

Each of the recovery wells are equipped with top-filling, air-operated pumps. At this time, we have set the inlets near the product interface to maximize free product recovery. They are checked and adjusted, as required, on a weekly basis. Liquids are all routed to a small tank, used for gauging recovery rates, that is emptied to the refinery sewer system (to the API separator).

I have attached the results of a complete groundwater elevation survey that I completed on October 21, 1991. As you can see from the hydrocarbon thickness measurements, our recovery wells are in good locations.

Please call me if you have any comments or questions about our system.

Sincerely yours,

Chris Hawley  
Environmental Manager

RE: Groundwater Remediation

Dear Mr. Olson:

Please be advised that we have completed the installation of the well casings for six monitor/recovery wells as outlined in our proposal of May 8, 1990. The only significant change from the proposal was the relocation of one of the wells from the north process area to south of the process area. This was required because of safety and access restraints.

I have enclosed some well completion information and casing specifications. Each of the wells indicated some presence of free product (maybe from a sheen to a couple of inches) and are thus good candidates for expanding our recovery well system. We will be evaluating the requirements and installing utilities and pumps as promptly as possible subsequent to our evaluation.

We appreciate your participation with us in this project. We will continue to keep you informed on our future progress.

Sincerely,

Chris Hawley  
Environmental Engineer

Subject: INSTALLATION OF GROUNDWATER RECOVERY WELLS 14, 15, 16, 17, 18, & 19

**Casing Material:** Casing material for each well consisted of 4" (4.5" O.D.) fiberglass epoxy casing in two sections. The bottom section included a bottom plug, a two feet silt leg, 18 feet of recovery screen with 0.020" slots spaced for low/medium flow (1/4" between slots), 6 feet of blank, and a belled, female, threaded end. The upper section of casing included a male, threaded connection with an "O" ring. The internal fit-up was flush. This section was cut off as required.

The casing was provided by:  
Enco-EMC  
Geoff Hunkin  
9620 - A Beck Circle  
Austin, Texas 78758  
(512) 834-9900

**Drilling Method:** Each well was drilled with an 8" bit and followed by a driven steel casing. Only air and some water, when required, was used to clear the hole. The driven steel casing kept the hole from collapsing in the gravel zone. The hole was completed into the top section of the Nacimiento formation. The steel casing was driven to at least the top of the Nacimiento.

**Casing Installation:** The 4" casing was set into the hole with the entire saturated zone included in the screened section. The silt legs were set into the Nacimiento and the top of the screened section was set well above the static water level. As the steel casing was withdrawn, 10/20 sand was added until sufficiently above the screened section. The recovery well was held in place as the steel casing was removed. After the sand pack was completed, the steel casing was removed completely. 40 pounds of bentonite and 100 pounds of concrete were used to plug the annular space around the casing and then backfilled to the surface with dirt.

The drilling and casing installations were done by:

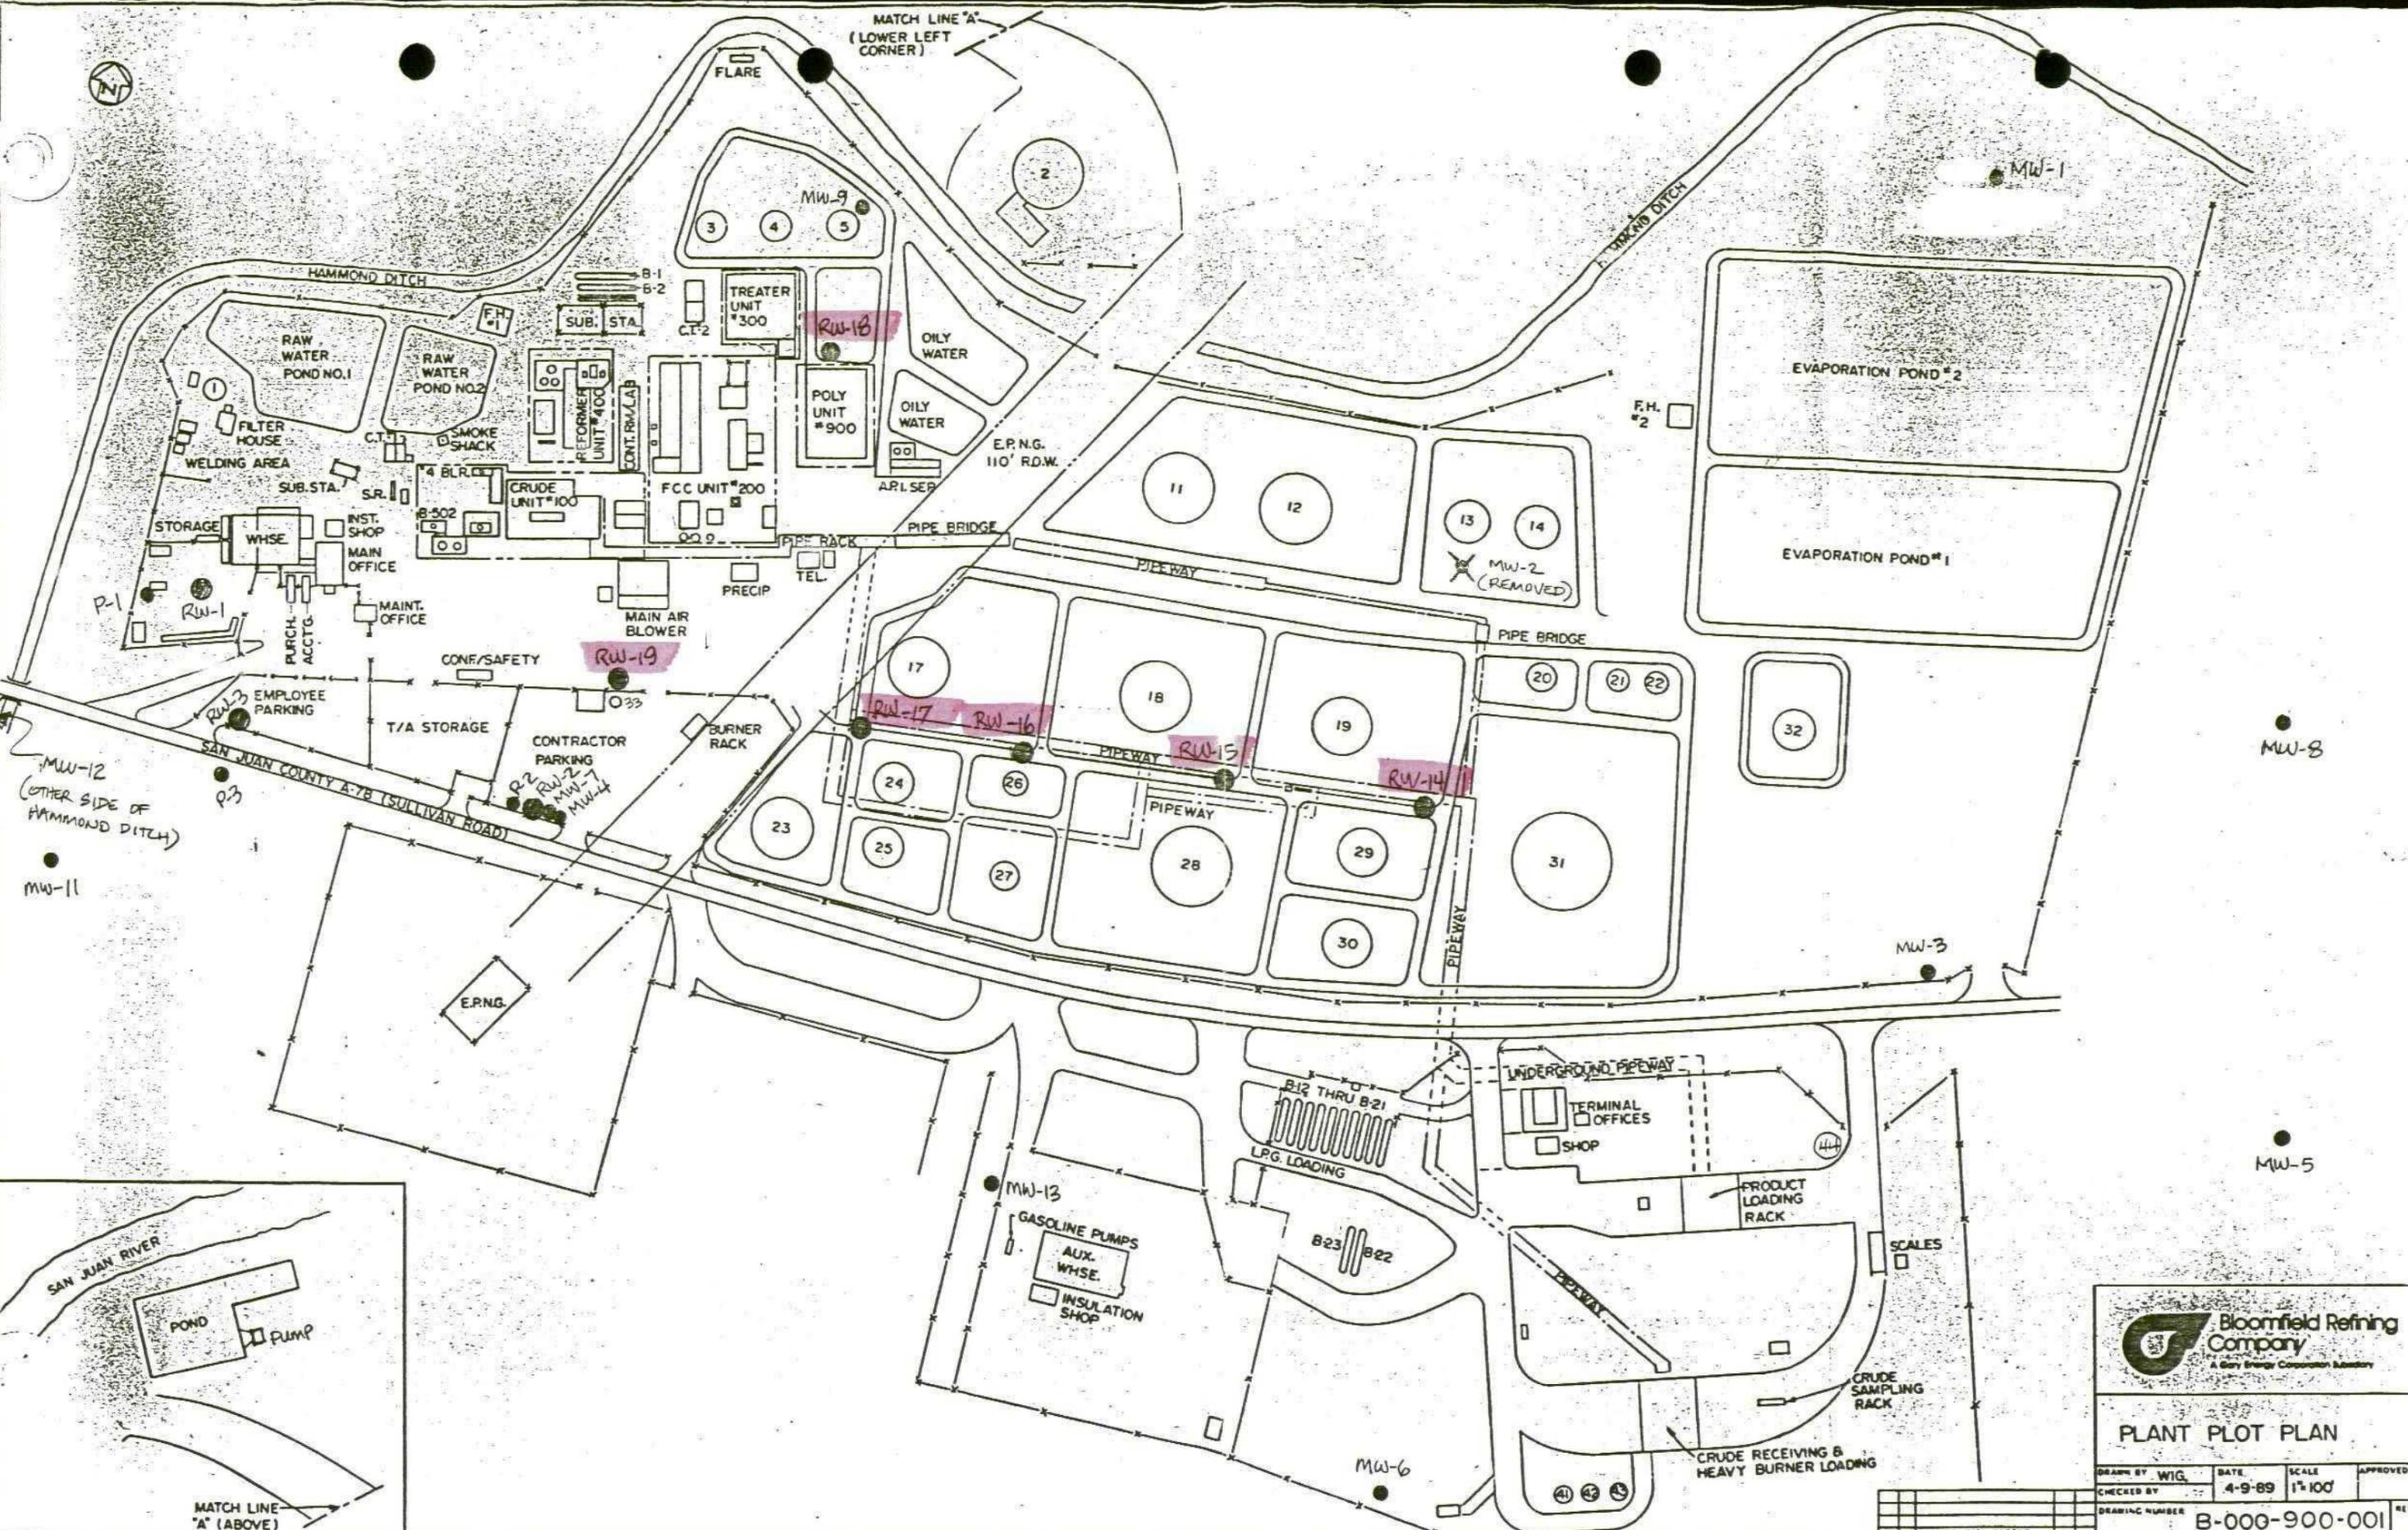

Beeman Bros. Drilling  
Leo Beeman  
31502 Hwy 160  
Durango, Colorado 81301  
(303) 259-1195

Installation Schedule:	<u>START</u>	<u>COMPLETE</u>
MW-14	8/6/90	8/6/90
MW-15	8/6/90	8/7/90
MW-16	8/7/90	8/7/90
MW-17	8/7/90	8/7/90
MW-18	8/8/90	8/8/90
MW-19	8/8/90	8/8/90

Measurements: Approximate measurements were made during installation and then verified by Chris Hawley on August 9, 1990 with internal measurements. Drawings were immediately prepared.

Surface Seals: Adequate surface seals will be installed at a later date after the requirements for pumping are determined.

RE: OCD WATER QUALITY SAMPLING AT THE GARY BLOOMFIELD REFINERY

Dear Mr. Hawley:

On April 9, 1990, the New Mexico Oil Conservation Division (OCD) sampled ground water from Gary Bloomfield Refinery monitor well MW-5 and the new lined pond for aromatic and halogenated volatile organics, general chemistry and metals. Enclosed you will find copies of the analytical results for the monitor well and the new lined pond. No aromatic or halogenated purgeable organics were detected in either of the samples.

If you have any questions please contact me at 827-5885.

Sincerely,

A handwritten signature in cursive script that reads "William C. Olson".
