**RE: Annual Report for Giant's Bloomfield Crude Station**

Dear Mr. Anderson:

Lodestar Services, Incorporated is pleased to submit the enclosed copy of *Annual Report, Bloomfield Crude Station, Bloomfield, New Mexico, March 2005* on behalf of Giant Industries Arizona, Inc.

Please call Mr. Tim Kinney of Giant at (505) 632-4001 or myself at (505) 334-2791 with any questions regarding this submittal.

Respectfully Submitted,  
**Lodestar Services, Inc.**

## LIST OF APPENDICES

APPENDIX A: ANALYTICAL LABORATORY REPORTS

APPENDIX B: COMPREHENSIVE SUMMARY OF GROUND WATER ANALYSES

PO Box 3861 Farmington, NM 87499-3861 Office (505) 334-2791

## Introduction

This annual report describes the work completed at Giant Industries Arizona, Inc.'s (Giant's) former Crude Station in Bloomfield, New Mexico since the previous annual report submitted during March 2004. This report includes data collected through January 2005 including:

- Bioventing quarterly carbon dioxide and oxygen monitoring measurements during 2004.
- Bioventing soil sampling in October 2004
- Groundwater sampling results from all wells on January 13, 2004
- Product removal from MW-2 during 2004.

The former Bloomfield Crude Station is located on the southwest corner of Blanco Boulevard and Fifth Street in the city of Bloomfield, San Juan County, New Mexico. The site occupies approximately 5.5 acres within the N ½, NW ¼, NW ¼ of Section 22, Township 29 North, Range 11 West. A regional location map is shown in Figure 1.

A 55,000 barrel crude oil storage tank was previously located at the site within an earthen berm, which occupied approximately 100,000 square feet on the west side of the former crude station. Tank 967-D and berms were removed between late 1995 and early 1996. Approximately 12,924 cubic yards of hydrocarbon impacted soil was removed and treated at Giant's Bisti land-farm. The excavation was backfilled and graded. Currently, the site is an unoccupied, open space. A site map presented as Figure 2 shows the boundary of the former excavation. West of the former tank site is a City of Bloomfield Electrical Substation and two well sites (Jan Redding #1 and Cook #1E) owned and operated by Manana Gas. To the west of the electric substation and Manana well sites, a vacant lot exists. What appears to be a monument may indicate a previous well site that has been plugged and abandoned. Historical research of this area indicate that several oil and possibly gas wells, may have once been operational on this lot, such as Bishop #1, Bishop #3, Hare #1 and Kittell #1 (Figure 2).

The former crude station has been the focus of a subsurface investigation where activities have included numerous soil borings and sampling, installation of seven ground water monitoring wells, excavation and offsite land farming of hydrocarbon impacted soil, and ground water sampling. The area of focused investigation is where the former crude oil storage tank numbered 967-D was located. A more detailed historical account can be found in a report previously submitted to the New Mexico Oil Conservation Division (NMOCD) titled *Comprehensive Report for the Bloomfield Crude Station*, dated January 2000. A chronology of site operations and investigations is found in the Golden Environmental Management report *Monitoring Well Installation, Ground Water Sampling and Bioventing Pilot Test Bloomfield Crude Station, Bloomfield, New Mexico*, dated July 2001.

## Methodology

Bioventing continues as described in the *March 2004 Annual Report* and according to *Bioventing Plan, July 2002* submitted to the New Mexico Oil Conservation Division during July 2002. Groundwater sampling at all monitoring wells followed accepted industry practices. Product (free phase crude oil) recovery was completed by measuring product thickness followed by hand bailing product and groundwater and storing it onsite in a 55 gallon drum.

### *Bioventing*

Bioventing is the process of supplying air to indigenous microorganisms to enhance natural mineralization of hydrocarbons to carbon dioxide and water. Following a successful bioventing pilot test on June 20, 2001 bioventing was initiated on February 17, 2003.

System installation during 2003 included hand boring three inch holes with a hand auger, collecting soil samples at three-foot intervals and screening the samples using headspace techniques. Eight soil samples with the highest headspace readings were submitted to Pinnacle Laboratories in Albuquerque, NM for benzene, toluene, ethylbenzene, xylenes (BTEX), and total petroleum hydrocarbon (THP) analyses by United States Environmental Protection Agency (USEPA) methods 8021 and 8015, respectively. Samples were collected in one quart plastic bags and split for headspace and laboratory analysis. Samples for laboratory analyses were immediately placed in four ounce glass jars, sealed, labeled, stored on ice, and shipped to the laboratory under strict chain-of-custody procedures.

Following sampling, one foot of one-inch diameter polyvinyl chloride .01 inch slotted well screen was set in each hole at approximately twelve feet beneath ground surface at thirty nine locations. Eighteen points are used for monitoring subsurface gasses and twenty one points are used to inject air. Monitoring and Injection point locations are shown on Figure 3.

Injection air is supplied by a Gast™ oil-less rotary vane compressor that supplies approximately 90 standard cubic feet per minute air. The compressor is housed in an existing office building on-site and travels through 1-1/2 inch PVC pipe to each injection point. Valves are located on each injection and monitoring point. The air is injected where field screening and laboratory analyses indicate elevated concentrations of hydrocarbons in the subsurface. Operations and maintenance are performed routinely to ensure the system is operational.

The compressor operates from 0000 hours to 1600 hours Monday through Fridays. Subsurface airflow and oxygen/carbon dioxide concentrations are monitored quarterly. Oxygen and carbon dioxide are measured using a GEM 500™ gas monitor. Each point is evacuated until the gas reading stable stable.

Comparative soil samples were collected following approximately eight months of system operations during October 2003 and then during October 2004. Soil samples were collected from a location approximately two feet from where initial eight soil samples were collected and

at the same depth as the original. These samples were also screened in the field using headspace techniques and submitted for laboratory analysis for BTEX and TPH by USEPA methods 8021 and 8015, respectively.

### *Ground Water Sampling*

On January 13, 2005 ground water samples and depth-to-ground water measurements were collected from monitoring wells MW-2 through MW-7. Each well was checked for the presence of free phase crude oil. Samples were collected from the six monitor wells. Giant abandoned monitoring well MW-1 during excavation of the tank pad. Samples were not previously collected from MW-2 due to presence of free phase crude oil. MW-7 was sampled at the request of the NMOCD though Giant believes groundwater impact at this location is not related to their operations as discussed in previous reports.

Using the previous quarter's analytical results, sampling began at the cleanest well and progressed to those containing higher concentrations of contaminants. Prior to sampling, depth to ground water and total depth of each well were measured with a Keck oil/water interface probe. Presence of any free phase crude oil was also investigated using the interface probe. The interface probe was decontaminated with Alconox™ soap and rinsed with de-ionized water prior to each measurement. The volume of water in the wells was calculated, and a minimum of three casing volumes of water was purged from each well using a disposable bailer. As water was extracted, pH, electric conductivity and temperature were monitored. The wells were purged until these properties had stabilized, indicating that the purge water was representative of aquifer conditions. These data were recorded within a bound field notebook.

Once each monitoring well was purged, ground water samples were collected by filling two 40-milliliter (ml) glass vials. The pre-cleaned and pre-preserved vials were filled and capped with no air inside to prevent degradation of the sample. Samples were labeled with the time and date of collection, as well as the origin of the sample. They were immediately sealed and packed on ice. The samples were shipped to Pinnacle Laboratories, Inc. (Pinnacle) in Albuquerque, New Mexico in a sealed cooler via Commercial Bus Lines. Proper chain-of-custody procedures were followed with logs documenting the project name and number, sampling point, location, field ID number, date, time, sample type, number of containers, analyses required and sampler's signatures (Appendix A). Pinnacle analyzed the samples for benzene, toluene, ethylbenzene and total xylenes (BTEX) by USEPA Method 8021.

Two 500 milliliter plastic bottles were filled with ground water for analysis of major cations and anions, total dissolved solids (TDS) and an ion balance by various EPA methods. These samples were labeled, stored on ice and transported to Inter-Mountain Laboratories in Farmington, New Mexico for analysis. The January 2005 samples were submitted to Pinnacle Laboratories. The samples were labeled with the project name, sampling location, field identification number, date, time, sample type, analysis required. Strict chain-of-custody procedures were followed.

*Product Recovery*

Free phase crude oil was intermittently present in MW-2 during 2004. An on-going effort to remove the floating product has involved manual bailing of product from the monitoring well using a disposable bailer. Any product removed from the well is collected in a 55-gallon drum on the site. Product and some water are bailed from the well until there is no measurable amount of free phase product in the well. Once the product has been removed, water depth is measured a second time. This process is carried out periodically based on the presence of product.

## Results

### Bioventing

The results from headspace field screening using a PhotoVac photo ionization detector (PID) during monitoring and injection point installation in October, 2002 were as follows.

**Table 1 Bioventing Headspace Results**

Headspace readings were recorded where there was physical evidence of impacted soil. The results of laboratory analyses from eight of the highest headspace reading locations are shown in Table 2. Also included in Table 2 are the results of sampling from the same locations collected one and two years later at the same depth approximately two and three feet from the original samples.

Ave.		-52%	-79%	-73.0%	-79.9%

nc: no change; nd: not detected; the results from MP-8 were not used in average change calculations

As shown on the above Table 2, Laboratory reports indicate a consistent decrease of the BTEX constituents and TPH constituents since bioventing operations began. TPH and BTEX were not detected in five of eight samples. BTEX concentrations were below NMOCD's *Guidelines for Remediation of Leaks, Spills and Releases* in the three locations where BTEX was detected. THP was reported greater than NMOCD's 100 ppm standard in three locations.

Laboratory analytical reports and chain-of-custody documentation are included in Appendix A.

The results of carbon dioxide and oxygen measurements during bioventing are as follows:

**Table 3 Results of Air Monitoring**

MP9	20.50	13.13	18.88	1	1.89	0.98
Average	20.23	13.86	13.43	0.79	3.77	5.55

Data from 2003 includes data from 2/03,3/03,10/03 and 1/04. Data from 2004 includes quarterly data from 4/04,7/04,10/04 and 1/05.

Measurements at individual monitoring points are shown on the Bioventing Data tables in Appendix B. Air monitoring points were, for the most part, installed away from the injection points that were installed in the areas of highest hydrocarbon concentrations. Because these points were away from hydrocarbons and hence biologic activity, initial oxygen concentrations were typically higher and carbon dioxide concentrations typically lower than readings in areas of higher hydrocarbon concentrations. The average oxygen concentration during 2003 at all monitoring points was sixty nine percent of pretest concentrations and sixty six percent of pretest concentrations during 2004. The average of all carbon dioxide concentrations at all monitoring points was four hundred and seventy seven percent of pretest concentrations during 2003 and seven hundred and percent of pretest concentrations during 2004.

### *Ground Water Sampling*

Depth-to-water measurements taken during January 2005 are shown in Table 4. During January 2005, water depth ranged from 22.50 feet beneath the top of the well casing (BTOC) in MW-7 to 14.52 feet BTOC in MW-2. Product was found in MW-2 during January 2004 through August 2004 and absent September 2004 to date. Free phase crude oil has never been found in any of the other wells. Ground water elevations were calculated, and inferred ground water elevation contour map is presented as Figure 4. Based on the contours, ground water movement appears to be to the southwest and the hydraulic gradient is 0.017 feet per feet.

**Table 4: Ground Water Elevation Data**

Well Number	Casing Elevation (ft)	Date	Depth to Water (ft)	Depth to Product (ft)	Product Thickness (ft)	Groundwater Elevation (ft)
MW-2	5485.33	1/13/05	14.52	np	np	5470.81
MW-3	5488.61	1/13/05	15.89	np	np	5472.72
MW-4	5486.18	1/13/05	15.62	np	np	5470.56
MW-5	5481.61	1/13/05	15.91	np	np	5465.70
MW-6	5486.18	1/13/05	17.67	np	np	5468.51
MW-7†	5491.86	1/13/05	22.50	np	np	5469.36

Notes:  
 Measuring points are marked by a notch in top of well casing  
 na: not applicable  
 np: indicates there was no free phase product present  
 Groundwater Elevation = (Surveyed Well Casing Elevation) - (Depth to Water)  
 Water level elevation is given in feet above mean sea level  
 \* MW-1 was abandoned by Giant in 2000

Laboratory analytical results for BTEX are presented in Table 5. Complete reports from Pinnacle Laboratories are included in Appendix A. During January 2005, BTEX was not detected in the groundwater from MW-3, MW-4, MW-5, and MW-6. The concentrations of Benzene in MW-2 and MW-7 were over New Mexico Water Quality Control Commission (NMWQCC) standards at 430 µg/L and 1600 µg/L, respectively. Toluene was not detected in these wells. Ethylbenzene concentrations were 360 µg/L in MW-2 and 220 µg/L in MW-7, beneath NMWQCC standards. Xylenes in MW-2 and MW-7 were over NMWQCC standards at 1000 µg/L and 1500 µg/L, respectively.

**Table 5: Ground Water Analytical Results**

NMWQCC Standards		Benzene (µg/L)	Toluene (µg/L)	Ethylbenzene (µg/L)	Total Xylenes (µg/L)

The results of general chemistry analyses for January 2005 are shown in Table 6. Results indicate high conductivity in all of the samples, ranging from 6800 micromhos per centimeter (µmhos/cm) to 1500 µmhos/cm. Total dissolved salts (TDS) are also high, with levels between 930 milligram per liter (mg/L) in MW-7 and 4800 mg/L in MW-5. All of the samples have concentrations greater than the New Mexico Water Quality Control Commission (NMWQCC)

domestic water supply standard for TDS of 1000 mg/L except the sample from MW-7. These results indicate a poor quality for potable use. The samples from wells MW-3, MW-4, MW-5, and MW-6 exceed the NMWQCC domestic water standard for sulfate at 2100 mg/L, 2200 mg/L, 1200 mg/L, and 940 mg/L, respectively. The standard for sulfate is 600 mg/L. The sample taken from MW-5 contained 1100 mg/L of chloride. The standard for chloride is 250 mg/L. The elevated levels of these parameters are indicators of the typically poor quality of shallow ground water at the site. The complete laboratory analytical reports are included in Appendix A. Historical general chemistry of ground water sampled at the Bloomfield Crude Station is included in Appendix B.

*Product Recovery MW-2*

During 2004, product thickness ranged from 0.13 feet in May 2004 to 0.0 feet in September 2004. Product has not been found since August, 2004. A comprehensive summary of product monitoring and recovery is presented in Table 7. The product and water is stored on-site in a 55 gallon drum.

## Conclusions

### *Bioventing*

Based on the decreased in concentrations of TPH and BTEX following approximately twenty months of operations, bioventing is effectively reducing the concentrations of hydrocarbons in the subsurface. Prior to bioventing in 2002 seven of eight soil samples were over NMOCD standards for TPH, none for benzene and four were over for total BTEX. One year later following eight months of bioventing, six samples were over NMOCD standards for TPH, none for benzene and one was over standards for total BTEX. Two years later following twenty months of bioventing three of eight samples were over NMOCD standards for TPH, none for benzene and no samples were over standards for total BTEX. The concentrations of oxygen and carbon dioxide recorded through January 2005 indicate sustained biologic activity at the site.

### *Ground Water Sampling*

Laboratory analyses of ground water samples from MW-3, MW-4, MW-5, and MW-6 did not identify any BTEX constituents. This is the first time BTEX has not been detected in the ground water sample from MW-6. The reduction in the concentrations of BTEX in the ground water and the continued absence of product in MW-2 is a significant milestone indicating that all of the product has been removed from the site. The ground water from MW-7 contains concentrations of benzene, and xylenes that are above NMWQCC standards and are not related to Giant's activities at the site do to the wells proximity to former oil and gas wells and it's offsite cross-gradient location.

The NMWQCC domestic use standards for total dissolved solids in ground water are exceeded at all monitoring wells including up-gradient well MW-3, except MW-7, indicating that the ground water is not suitable for domestic use. That the ground water from MW-7 is significantly lower in TDS also indicates that the problems at MW-7 are not related to Giant's operations.

The potentiometric surface elevation has risen since last year probably due to increased precipitation. The general direction and flow gradient remain static. Ground water flow is to the southwest at 0.017 ft/ft.

### *Product Recovery*

Product recovery at MW-2 has resulted in the removal of the free phase product from the well.

## Recommendations

After compiling the most recent analytical results and comparing these with historical results, the following remedial action and monitoring plan is recommended:

- Continue bioventing at the site to reduce the hydrocarbon concentrations in soil to below NMWQCC standards. Increase airflows where necessary to enhance degradation.
- Collect soil samples during October 2005 to monitor progress of remediation.
- Also during October 2005, turn off the bioventing system for one week and measure the concentrations of hydrocarbons in the soil gas at all monitoring and injection points.
- Monitor MW-2 monthly for product.
- Conduct annual ground water sampling for BTEX at all monitoring wells during January 2006.
- Prepare an annual report in March 2006.

Cooler Number(s) & Temp(s) °C: Cherit 3.0°C IR-1  
(IE: #340L, 4°C, IR-1 - COOLER NUMBER, TEMPERATURE, THERMOMETER NUMBER)

Comments (reference item numbers above and list sample IDs/Tests where appropriate):  
\*limited volume for sample mw-2/501099-05.

Inspected By: RA Date: 01-18-05 Logged By: LLK Date: 18-Jan-05

Note all Out-of-Control and/or questionable events on Comment Section of this form. For holding times, the analytical department will flag immediate hold time samples (pH, Dissolved O2, Residual CU) as out of hold time, therefore, these samples will not be documented on this PSIF.

All volatile samples requested to be split or composited must be done in the Volatile Lab. Document: "Volatile sample vials may be compromised due to sample splitting (compositing)"

All pH results for North Carolina, and other requested projects are to be recorded on the pH log provided (STL-SOP 938L)

According to EPA, a bubble of 1/4" or less is acceptable in 40 ml vials requiring volatile analysis. According to Florida DEP, excess headspace in liquid TCLP volatile containers shall be documented.

ProjectManagementPensacola\Forms\PSIF.DOC June 18, 2004

**Organic Data Qualifiers for Final Report**

- B The analyte was detected in the method blank and in the client's sample.
- D The result was obtained from a dilution.
- E The result exceeds the calibration range.
- J Estimated value because the analyte concentration is less than the reporting limit.
- M A matrix effect was present.
- N Presumptive evidence of a compound. The compound was identified qualitatively or as a Tentatively Identified Compound.
- N/C Not Calculable. Either the sample spiked was > 4X spike concentration, or the compound was diluted out, or the results of sample duplicate analysis were <RL.
- P Second-column or detector confirmation exceeded method criteria. Appropriate value is reported and data is flagged/qualified as instructed by method/regulation.
- U or < or ND The analyte was not detected.
- \* The result is not within control limit(s).

**Inorganic Data Qualifiers for Final Report**

- B The analyte was detected in the method blank and in the client's sample.
- E The reported value is estimated because of the presence of interference.
- J Estimated value because the analyte concentration is less than the reporting limit.
- N The spiked sample recovery is not within control limits.
- N/C Not Calculable. Either the sample spiked was > 4X spike concentration, or the compound was diluted out, or the results of sample duplicate analysis were <RL.
- < or ND The analyte was not detected.
- M Duplicate analysis not within control limits
- M The duplicate injection precision was not met.
- S The reported value was determined by the Method of Standard Addition (MSA).
- W Post-digestion spike for Furnace AA analysis is out of control limits (85-115%), while sample absorbance is less than 50% of spike absorbance and post spike recovery is greater than or equal to 40%, the sample is flagged with a "W" and no further action is required.
- † The Standard Additions Correlation Coefficient is <0.995.
- † The result is not within control limit(s).

It is permissible to submit an Out-of-Control Events/Corrective Action form and/or Case Narrative in lieu of using above qualifiers.

When the laboratory receives a sample that does not meet EPA requirements for sample collection, preservation or holding time, the laboratory is required to reject the samples. The client must be notified and asked whether the lab should proceed with analysis. Data from any samples that do not meet sample acceptance criteria (collection, preservation and holding time), must be flagged, or noted on a corrective action form or case narrative, or addressed on the Project Sample Inspection Form (PSIF) in an unambiguous manner clearly defining the nature and substance of the variation. NPDES samples from North Carolina that do not meet EPA requirements for sample collection, preservation or holding time are non-reportable for NPDES compliance monitoring.

**Abbreviations**

- ND Not Detected at or above the STL Pensacola reporting limit (RL)
- NS Not Submitted
- NA Not Applicable
- MDL STL Pensacola Method Detection Limit
- RL STL Pensacola Reporting Limit
- MS Not enough sample provided to prepare and/or analyze a method-required matrix spike (MS) and/or duplicate (MSD)
- IC Tentatively Identified Compound

**Florida Projects Inorganic/Organic**

Refer to FL DEP 62-160; Table 4 Data Qualifier Codes. FL DEP Rule 62-160, Table 1 lists the Florida sites which require data qualifiers.

**DEQ Projects**

Any qualified data submitted to Arizona DEQ (ADEQ) after January 1, 2001 must be designated using the Arizona Data Qualifiers as developed by the Arizona LAC technical subcommittee. Refer to the ADEQ qualifier list.

Attention:                      MARTIN NEE/TIM KINNEY

On 01/15/2005 Pinnacle Laboratories Inc., (ADHS License No. AZ0643), received a request to analyze aqueous samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

EPA Method 8021 was performed by Pinnacle Laboratories, Inc., Albuquerque, NM.

All other analyses were performed by Severn Trent Services, Pensacola, FL.

If you have any questions or comments, please do not hesitate to contact us at (505) 344-3777.

H. Mitchell Rubenstein, Ph.D.
