Re: TEPPCO NGL Pipelines, LLC
TEPPCO Val Verde System Discharge Permit Renewals
San Juan and Rio Arriba County, New Mexico

Dear Mr. Price:

TEPPCO NGL Pipelines, LLC ("TEPPCO") is submitting the enclosed signed groundwater discharge plans for 9 of its Val Verde Gas Gathering system compressor stations and 1 gas plant located in San Juan and Rio Arriba Counties, New Mexico. Enclosed with the discharge plan renewal is TEPPCO Check No. **020001128** (Attachment 3) in the amount of **\$19,300.00** for the permit fees. Please refer to the attached facility schedule (Attachment 2) which outlines the submittal dates and payments made for the filing fees and permit fees. Please note the application filing fees for each facility were previously paid with the submittal of the groundwater discharge plan renewal applications.

TEPPCO does not request any major changes to the permit documents as prepared by the New Mexico OCD; however, the dates referenced for the submittal of the discharge plan renewals are not correct for each facility. Each permit states that the renewal applications were submitted on October 31, 2005; however, the 10 renewals were submitted on a staggered schedule ranging from October 11, 2005 to October 31, 2005. Please refer to the attached facility schedule for the appropriate renewal submittal dates.

Notwithstanding the submittal of the enclosed permit fees and documents, TEPPCO does not waive its right to question or dispute the need and/or requirement for this permit at the referenced facilities or other Val Verde facilities.

If you have any questions or require additional information, please contact Peter Cain at (713) 284-5213 or myself at (713) 759-3553.

Sincerely,

Deodax P. Bhagwandin
Manager, Environmental Protection

TE Products Pipeline Company, Limited Partnership
TEPPCO GP, Inc., General Partner

Val Verde Gas Gathering System Permit Renewal Costs and Schedule

Priority	Station Name	Permit #	Expiration Date	Submittal Date	Application Fee	Permit Fees

Subject: TEPPCO Val Verde Discharge Permits

Mr. Price,

I wanted to let you know that we have signed and completed the discharge permits that you submitted to us at the beginning of April. We have sent them back to you via Federal Express Next Day. You should receive them by Monday. Also included is a check for the permit fees for all 10 facilities and a spreadsheet outlining all 10 facilities and the permit fees due. Please let me know if you do not receive the package.

While we really don't have any comments regarding the permits, I wanted to note that each discharge permit stated that the renewals were submitted on October 31, 2005, while in fact, they were submitted on a staggered schedule beginning October 11, 2005 until October 31, 2005. You may want to make note of that and perhaps change this language for each particular facility. Again, the spreadsheet outlines the dates in which we submitted the renewal applications.

Thanks for your assistance in this matter and please let us know if you have any questions. We enjoyed meeting you back in February and look forward to working with you more in the future.

Regards,

Peter L. Cain

NOTICE OF PUBLICATION

STATE OF NEW MEXICO
ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT
OIL CONSERVATION DIVISION

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations, the following discharge permit application(s) has been submitted to the Director of the Oil Conservation Division, 1220 S. Saint Francis Drive, Santa Fe, New Mexico 87505, Telephone (505) 476-3440:

Ms L. Kristine Aparicio, Manager Environmental Protection, TEPPCO NGL Pipelines, LLC., 2929 Allen Parkway, 70019 P.O. Box 2521 Houston, Texas 77252-2521, telephone 713-759-3636, has submitted renewal applications for the previously approved discharge plans operated by Duke Energy Field Services for the following facilities:

Gobernador Compressor Station GW-056 located in NW/4 NW/4 of Section 31-Township 30N-Range 7W Rio Arriba County, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 80 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Pump Mesa Compressor Station GW-148 located in SE/4 of Section 14-Township 31N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of greater than 20 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Sims Mesa Compressor Station GW-146 located in NE/4 of Section 22-Township 30N-Range 7W Rio Arriba Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of greater than 14 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Pump Canyon Compressor Station GW-057 located in NW/4 SW/4 of Section 24-Township 30N-Range 9W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 40-120 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Manzanares Compressor Station GW-059 located in SW/4 SE/4 of Section 4-Township 29N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 211 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Hart Canyon Compressor Station GW-058 located in NW/4 SE/4 of Section 20-Township 31N-Range 10W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 130 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Val Verde Treater Gas Processing Plant Station GW-051 located in SE/4 SE/4 of Section 11-Township 29N-Range 11W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 26-55 feet with an estimated total dissolved solids concentration matching that of the San Juan River and Citizens Ditch..

Arch Rock Compressor Station GW-183 located in NW/4 SW/4 of Section 14-Township 31 -Range 10W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 51 feet with an estimated total dissolved solids concentration of 1300 mg/l.

Frances Mesa Compressor Station GW-194 located in SW/4 SW/4 of Section 27-Township 30N-Range 7W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 240 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Sandstone Compressor Station GW-193 located in SE/4 SE/4 of Section 32-Township 31 N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 80 feet with an estimated total dissolved solids concentration of 1700 mg/l.

The discharge plans addresses how best management practices will be used to properly handle, store, and dispose of oilfield materials and waste. The plan will also have contingencies for preventing and managing releases of accidental discharges of water contaminants to the surface in order to protect fresh water.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge permit application and draft discharge permit may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. The draft discharge permit may also be viewed at OCD's web site <http://www.emnrd.state.nm.us/ocd/>. Prior to ruling on any proposed discharge permit or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted and a public hearing may be requested by any interested person. Requests for a public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed permit based on information available. If a public hearing is held, the director will approve or disapprove the proposed permit based on information in the permit and information submitted at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 30th day of November 2005.

Manzanares Compressor Station GW-059 located in SW/4 SE/4 of Section 4-Township 29N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 211 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Hart Canyon Compressor Station GW-058 located in NW/4 SE/4 of Section 20-Township 31N-Range 10W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 130 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Val Verde Treater Gas Processing Plant Station GW-051 located in SE/4 SE/4 of Section 11-Township 29N-Range 11W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 26-35 feet with an estimated total dissolved solids concentration matching that of the San Juan River and Citizens Ditch.

Arch Rock Compressor Station GW-183 located in NW/4 SW/4 of Section 14-Township 31-Range 10W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 51 feet with an estimated total dissolved solids concentration of 1300 mg/l.

Frances Mesa Compressor Station GW-194 located in SW/4 SW/4 of Section 27-Township 30N-Range 7W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 240 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Sandstone Compressor Station GW-193 located in SE/4 SE/4 of Section 32-Township 31 N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 80 feet with an estimated total dissolved solids concentration of 1700 mg/l.

The discharge plans addresses how best management practices will be used to properly handle, store, and dispose of oilfield materials and waste. The plan will also have contingencies for preventing and managing releases of accidental discharges of water contaminants to the surface in order to protect fresh water.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge permit application and draft discharge permit may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. The draft discharge permit may also be viewed at OCD's web site <http://www.emnrd.state.nm.us/ocd/>. Prior to ruling on any proposed discharge permit or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted and a public hearing may be requested by any interested person. Requests for a public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed permit based on information available. If a public hearing is held, the director will approve or disapprove the proposed permit based on information in the permit and information submitted at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 30th day of November 2005.

NOTICE OF PUBLICATION

STATE OF NEW MEXICO ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT OIL CONSERVATION DIVISION

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations, the following discharge permit application(s) has been submitted to the Director of the Oil Conservation Division, 1220 S. Saint Francis Drive, Santa Fe, New Mexico 87505, Telephone (505) 476-3440:

Ms L. Kristine Aparicio, Manager Environmental Protection, TEPPCO NGL Pipelines, LLC., 2929 Allen Parkway, 70019 P.O. Box 2521 Houston, Texas 77252-2521, telephone

713-759-3636, has submitted renewal applications for the previously approved discharge plans operated by Duke Energy Field Services for the following facilities:

Governador Compressor Station GW-056 located in NW/4 NW/4 of Section 31-Township 30N-Range 7W Rio Arriba County, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 80 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Pump Mesa Compressor Station GW-148 located in SE/4 of Section 14-Township 31N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of greater than 20 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Sims Mesa Compressor Station GW-146 located in NE/4 of Section 22-Township 30N-Range 7W Rio Arriba Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of greater than 14 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Pump Canyon Compressor Station GW-057 located in NW/4 SW/4 of Section 24-Township 30N-Range 9W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 40-120 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Manzanares Compressor Station GW-059 located in SW/4 SE/4 of Section 4-Township 29N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 211 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Hart Canyon Compressor Station GW-058 located in NW/4 SE/4 of Section 20-Township 31N-Range 10W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 130 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Val Verde Treater Gas Processing Plant Station GW-051 located in SE/4 SE/4 of Section 11-Township 29N-Range 11W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 26-55 feet with an estimated total dissolved solids concentration matching that of the San Juan River and Citizens Ditch.

Arch Rock Compressor Station GW-183 located in NW/4 SW/4 of Section 14-Township 31 -Range 10W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 51 feet with an estimated total dissolved solids concentration of 1300 mg/l.

Frances Mesa Compressor Station GW-194 located in SW/4 SW/4 of Section 27-Township 30N-Range 7W San Juan Country, New

Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 240 feet with an estimated total dissolved solids concentration of 1700 mg/l.

Sandstone Compressor Station GW-193 located in SE/4 SE/4 of Section 32-Township 31 N-Range 8W San Juan Country, New Mexico. Groundwater most likely to be affected by a spill, leak, or accidental discharge to the surface is at a depth of 80 feet with an estimated total dissolved solids concentration of 1700 mg/l.

The discharge plans addresses how best management practices will be used to properly handle, store, and dispose of oilfield materials and waste. The plan will also have contingencies for preventing and managing releases of accidental discharges of water contaminants to the surface in order to protect fresh water.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge permit application and draft discharge permit may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. The draft discharge permit may also be viewed at OCD's web site

<http://www.emnrd.state.nm.us/ocd/>. Prior to ruling on any proposed discharge permit or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted and a public hearing may be requested by any interested person. Requests for a public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

No public hearing is held; the Director will approve or disapprove the proposed permit based on information available. If a public hearing is held, the director will approve or disapprove the proposed permit based on information in the permit and information submitted at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 30th day of November 2005.

Re: TEPPCO NGL Pipelines, LLC
TEPPCO Gobernador Compressor Station
Rio Arriba County, New Mexico
Groundwater Discharge Plan (GW-056) Renewal Application

RECEIVED
NOV - 6 2005
OIL CONSERVATION
DIVISION

To Whom it May Concern:

TEPPCO NGL Pipelines, LLC ("TEPPCO") is submitting the enclosed Groundwater Discharge Plan Application (Attachment 1) for its TEPPCO Gobernador Compressor Station in Rio Arriba County, New Mexico. Enclosed with the discharge plan renewal application is TEPPCO Check No. **0200429128** (Attachment 4) in the amount of **\$100.00** for the application filing fee. The permit fee in the amount of \$1,700 will be paid once the application is approved.

As mentioned in previous permit renewal application submitted by the former operator, Duke Energy Field Services ("DEFS"), TEPPCO does not believe that a discharge plan is required for this facility under the Water Quality Control Commission ("WQCC") regulations because there are no discharges from the TEPPCO Gobernador Compressor Station.

Notwithstanding the submittal of the enclosed permit fees and documents, TEPPCO does not waive its right to question or dispute the need and/or requirement for this permit at the referenced facility or other Val Verde facilities.

If you have any questions or require additional information, please contact Peter Cain at (713) 284-5213 or myself at (713) 759-3654.

Sincerely,

L. Kristine Aparicio

New Renewal Modification

1. Type: TEPPCO Gobernador Compressor Station
2. Operator: TEPPCO NGL Pipelines, LLC
Address: PO Box 2521, Houston, Texas 77252-2521
Contact Person: L. Kristine Aparicio Phone: 713-759-3636
3. Location: NW /4 NW /4 Section 31 Township 30N Range 7W
Submit large scale topographic map showing exact location.
4. Attach the name, telephone number and address of the landowner of the facility site.
5. Attach the description of the facility with a diagram indicating location of fences, pits, dikes and tanks on the facility.
6. Attach a description of all materials stored or used at the facility.
7. Attach a description of present sources of effluent and waste solids. Average quality and daily volume of waste water must be included.
8. Attach a description of current liquid and solid waste collection/treatment/disposal procedures.
9. Attach a description of proposed modifications to existing collection/treatment/disposal systems.
10. Attach a routine inspection and maintenance plan to ensure permit compliance.
11. Attach a contingency plan for reporting and clean-up of spills or releases.
12. Attach geological/hydrological information for the facility. Depth to and quality of ground water must be included.
13. Attach a facility closure plan, and other information as is necessary to demonstrate compliance with any other OCD rules, regulations and/or orders.

14. CERTIFICATION I hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

GROUNDWATER DISCHARGE PLAN

This document constitutes a renewal application for the Groundwater Discharge Plan for the Gobernador Compressor Station in Rio Arriba County, New Mexico. This Groundwater Discharge Plan has been prepared in accordance with the NMOCD "Guidelines for the Preparation of Discharge Plans at Natural Gas Plants, Refineries, Compressor and Crude Oil Pump Stations" (rev. 12-95) and the New Mexico Water Quality Control Commission ("WQCC") regulations, 20.6.2.3-104 and 3-106 NMAC.

1 Type of Operation

The facility does not intend or have a discharge or discharges that may move directly or indirectly into groundwater.

2 Operator / Legally Responsible Party

Operator
TEPPCO NGL Pipelines, LLC
PO Box 2521
Houston, Texas 77252-2521
(713) 759-3636
Contact Person: L. Kristine Aparicio

Owner
Val Verde Gas Gathering Company, LP
PO Box 2521
Houston, Texas 77252-2521

3 Facility Location

NW/4, NW/4 of Section 31, Township 30N, Range 7W

4 Landowner

U.S. Department of the Interior
Bureau of Land Management
1235 La Plata Highway
Farmington, NM 87499
(505) 599-8900

5 Facility Description

The facility provides natural gas compression for the gathering system.

6 Materials Stored or Used

There are no materials stored on-site or used that are discharged on site so that they may move directly or indirectly into groundwater.

7 Sources and Quantities of Effluent and Waste Solids

There are no effluents or waste solids that are discharged on-site or off-site at the TEPPCO Gobernador Compressor Station. All effluent and waste solids generated at the facility are removed from the facility for off-site disposal in accordance with applicable NMOCD, New Mexico Environmental Department ("NMED"), and EPA regulations as stated in previous groundwater discharge plans.

Separators/Scrubbers

Effluents or waste solids generated from separators or scrubbers are not discharged on site so that they may move directly or indirectly into groundwater.

Boilers and Cooling Towers/Fans

There are no boilers or cooling towers/fans at the facility.

Process and Storage Equipment Wash Down

Effluent or waste solids generated from process and storage equipment wash down are not discharged on site so that they may move directly or indirectly into groundwater.

Solvents/Degreasers

Solvent or degreasers are not discharged on site so that they may move directly or indirectly into groundwater.

Spent Acids/Caustics

If generated, spent acids or caustics are not discharged on site so that they may move directly or indirectly into groundwater.

Used Engine Coolants

Engine coolants are not discharged on site so that they move directly or indirectly into groundwater.

Waste Lubrication and Motor Oils

Lubricating and motor oils are not discharged on site so that they may move directly or indirectly into groundwater.

Used Oil Filters

Used oil filters are not discharged on site so that they may move directly or indirectly into groundwater.

Solids and Sludges

Solids and sludges are not discharged on site so that they may move directly or indirectly into groundwater

Painting Wastes

Painting wastes are not discharged on site so that they may move directly or indirectly into groundwater

Sewage

There are no restroom facilities at the facility. A portable toilet is kept on site.

Lab Wastes

Lab wastes are not generated at the facility.

Other Liquids and Solid Wastes

Other liquids and solid wastes are not discharged on site so that they may move directly or indirectly into groundwater.

8 Liquid and Solid Waste Collection / Storage / Disposal**Collection / Storage**

All liquid and solid wastes are collected and stored in closed containers for off-site disposal.

On-site Disposal

There are no on-site disposal activities at the facility

Off-site Disposal

All liquid and solid wastes are disposed off site.

9 Proposed Modifications

No modifications are proposed at this time.

10 Inspection, Maintenance, and Reporting

Routine inspections and maintenance are performed to ensure proper collection, storage, and off-site disposal of all wastes generated at the facility.

11 Spill / Leak Prevention and Reporting (Contingency Plans)

TEPPCO will respond to and report spills as outlined in the TEPPCO SPCC plan for TEPPCO Gobernador Compressor Station and in accordance with the requirements of NMOCD Rule 116 (19.15.C.116) and WQCC regulation (20.6.2.1203 NMAC)

12 Site characteristics

Geological/hydrological information for this facility has not changed since the previous renewal application.

Hydrologic Features

Gobernador Wash runs along the southwest edge of the site. There are several named and unnamed surface waters within one mile of the station including Gobernador Wash, NAPA irrigation canal, and stock ponds). The site generally slopes to the southwest.

Cathodic well data in the area indicates the depth to groundwater to be approximately 80 feet.

Based on a review of the topographic map for the area, groundwater flow direction is likely to be to the southwest. This would be consistent with an existing wash/arroyo which runs along the southwest edge of the site.

Geologic Description

The aquifer most likely to be affected by a discharge in this area is the San Jose formation. Total Dissolved Solids (TDS) of water from this formation is estimated to have an average greater than 1700 mg/l. This formation is characterized by interbedded sandstones and mudstones. The thickness of the formation ranges up to nearly 2,700 feet, in the basin between Cuba and Gobernador.

The site is underlain predominately by stratified clay, overlaying sand soils with varying amount of silt and clay, overlaying formational shale and/or sandstone. Auger refusal was encountered at about 26 feet on one of the borings. Groundwater was not encountered in any of the borings.

TEPPCO Gobernador Compressor Station lies approximately 5.5 miles to the east of the San Juan River. This area is not typically subject to flooding, therefore special flood protection measures are not needed.

13 Additional Information

Any unauthorized releases or discharge will be reported to the NMOCD in accordance with NMOCD Rule 116, 19.15.C.116 NMAC, and WQCC regulation, 20.6.2.1203.

Subject: Change in Ownership
Val Verde System

Dear Mr. Price:

On behalf of Val Verde Gas Gathering Company, LP, Duke Energy Field Services, LP (DEFS) is submitting notification of a change in ownership of 14 facilities in Rio Arriba and San Juan Counties, New Mexico. Effective July 1, 2002, Val Verde Gas Gathering Company, LP is the new owner of the facilities identified in the attached list. The attachment lists the facility name, discharge plan number and legal location.

DEFS will be operating the facilities identified in the attached lists. Therefore, DEFS requests the transfer of the discharge plans identified in the attached list to Duke Energy Field Services, LP.

DEFS will comply with the terms and conditions of the previously approved discharge plans submitted by Burlington Resources Gathering, Inc.

If you have any questions regarding this transfer of ownership and/or the discharge plans, please call me at (303) 605-1717.

Sincerely,
Duke Energy Field Services, LP

Re: Results of the annual sump integrity inspection program - Val Verde Facilities.

Dear Mr. Price:

The purpose of this correspondence is to provide your office with written notice that Duke Energy Field Services (DEFS) completed the annual sump integrity testing at its Val Verde Area Facilities. I have sent you multiple copies of this letter such that you can file one copy per site.

The below listed facilities have double wall sumps with leak detection between the walls. The following actions were taken at each facility sump:

1. Visually inspect for liquids between the sump walls
2. Pull the leak sensor
3. Place it in water.
4. Check the control panel for a positive indication of a leak
5. Return the leak sensor.
6. Check the control panel to assure a return to a negative reading

These procedures were implemented at each of the inspections, at the facilities below. There were no visual signs of leaks and all equipment functioned correctly.

Facility Name / inspection date	Visual inspection	Electronic Sensor	Facility Name	Visual inspect	Electronic Sensor
Arch Rock 8/20/02	PASS	PASS	Middle Mesa 8/23/02	PASS	PASS

The sump at the Quinn Compressor Station is double walled, but there is no leak detection system. A visual inspection of the space between the two sump walls showed no liquid. Additionally, the inner tank was pressured up with nitrogen to three pounds of pressure. The pressure was observed for 30 minutes, with no reduction. It was determined that the Quinn sump was structurally sound.

There are two sumps at the Val Verde Treater. (T-5419 and T8419) These two sumps were cleaned and inspected on August 18, 2002. The sumps are double walled and the secondary containment space was inspected for leaks from the primary tank. This area was found to be dry with no indication of a leak on both sumps. The high level alarm was tested in each sump and found to be operational. The ejection pumps were tested and found to be in good working order on each unit. After inspection, the sumps were cleaned and vacuumed to prevent any solid material from plugging the pumps. The sumps were inspected and photographed. It was determined that the two Val Verde sumps were structurally sound.

This completes the 2002 Val Verde Area annual sump inspection program. Thank you for reviewing this summary letter report. Should any questions arise, please notify me at 303 605 1726.

Sincerely yours,

Jack E. Braun
Sr. Env. Specialist

Re: 2001 Compressor Station Sump and Line Testing Integrity Inspections

Dear Mr. Price:

The purpose of this correspondence is to provide your office with written notice that the sumps at the following compressor stations were visually tested in September 2001 (OCD Discharge Plan Special Condition # 8). In addition, five of the stations successfully completed the required underground wastewater line testing (OCD Discharge Plan Condition # 9) at the same time as sump inspections. All the stations passed the required testing. No evidence of discharges of wastewater was observed during the testing. Under the normal gravity draining operation of the drain lines, no discharge of wastewater is expected.

* Underground Line Testing

For the visual sump inspection, the sumps were completely emptied, cleaned and the lids removed to allow access to each unit. The underground line testing was conducted using the process approved in the OCD's letter dated November 19, 1998. Basically, the procedure is as follows:

1. Underground lines will be plugged at the end of the sump.
2. At the entry point of the underground lines a threaded site glass column assembly will be installed.
3. After all exit points are sealed, the underground lines will be filled with water to a common mark on a glass column assembly. The site glass filling mark will be of sufficient height to be equivalent to a static head pressure of at least 3 psi on the piping system.
4. The site glass will be monitored for 30 minutes.
5. The test will be deemed successful if the level does not fluctuate from the test mark on the glass column.

Please note, BR has included a copy of this letter for each test completed to assist in the distribution of the letter in your files. If you have questions or need additional information, please contact me at (505) 326-937.

Sincerely,

Gregg Wurtz
Environmental Representative

RE: Burlington Resources Compressor Station Site Inspections 2000. Manzanares GW-05, Gobernador GW-056, Pump Mesa GW-148, Quinn GW-239, Sandstone GW-193, Rattlesnake GW-093, Buena Vista GW-255, Pump Canyon GW-057, Hart Canyon GW-058, Cedar Hill GW-258, and Middle Mesa GW-07:

Dear Mr. Price:

New Mexico Oil Conservation Division (OCD) conducted site inspections of 11 Burlington Resource's (BR) compressor stations that have discharge plan permits. Subsequent to these inspections OCD provided a list of inspection recommendations.

BR has successfully completed the recommendations detailed in OCD's inspection report. The written responses to each recommendation are provided in italic bold print following the OCD comment.

Manzanares GW-059:

1. Discharge of oil from the compressors is being deposited on the ground. ***BR removed the stained gravel, deeply raked the underlying soil, applied a remediation enhancing potassium permanganate solution and placed new gravel. An analysis of the cause of the contamination is being performed to identify the source of the hydrocarbon staining. The oil staining appears to be superficial, impacting only the surface gravel and top 2-3 inches of soil underlying the gravel. No direct cause has been determined except for over spray from the engine starter stacks located on this end of the building. The stacks were modified in 1999 with drains to prevent oil accumulations in stacks. Additional modifications to the design may be necessary.***
2. Oil stain found around wastewater tank. ***BR removed the stained gravel, deeply raked the underlying soil, applied a remediation enhancing potassium permanganate solution and covered the soil with new gravel. The tank integrity was visually verified as satisfactory and tank-gauging records do not indicate a tank leak has occurred. The likely source of the staining was an historic minor tank upset that may not have been completely cleaned from the sides and base of tank.***

Gobernador GW-056:

Compressor building drain lines will not hold pressure. *BR proposed an alternative drain line test during the inspection. The test proposed and implemented was a volume in/volume out drain line test and an analysis of risk for the liquids transported in the drain line system. The volume in/volume out drain line test was successfully completed and demonstrated insignificant risks to the environment from the waste drain line system. A more complete description of the testing procedures and results are provided in Attachment 1.*

Pump Mesa GW-148:

1. Oil stain around produced water tank. *BR applied a remediation enhancing potassium permanganate solution to the gravel. The staining was superficial and limited to the top surface of the gravel. The cause of the staining was believed to be a dump valve that may have stuck open causing over spray from the top of the tank where the dump line enters the tank.*
2. Oil stain around compressor sump pump. *BR removed the stained gravel, deeply raked the underlying soil, applied a remediation enhancing potassium permanganate solution and placed new gravel. Hydrocarbon staining was limited to the top 2-4 inches of the soil underlying the gravel. The pump seals were replaced and the pump no longer leaks oil.*

Quinn GW-239:

TEG and De-hydrator wastewater tank secondary liner is torn. *The TEG tank was determined to be a double wall tank and in satisfactory condition. The plastic under the TEG was not replaced and the berm was left in place as tertiary containment. The containment liner under the dehydrator wastewater tank was replaced and berm rebuilt.*

Sandstone GW-193:

Tank farm area lube oil pump is leaking and produced water tank is wet around base. *Replacing the pump seals repaired the lube oil pump. The gravel and soil around the pump was deeply raked and a remediation enhancing potassium permanganate solution was applied and new gravel placed. The oil contamination was limited to the top 2-4 inches of soil underlying the gravel. The wet area around the tank was believed to be natural water and no contamination or tank problems were detected.*

Rattlesnake GW-093:

1. Motor oil and anti-freeze storage tanks do not have proper containment. *Containments under both tanks were upgraded to meet OCD's requirements.*
2. Oil and water observed in condensate underground wastewater storage tank leak detector. *The fiberglass wastewater storage tank was removed and replaced with a new metal tank. The condition of the fiberglass tank was satisfactory with no evidence of leaking. Historic contamination was detected adjacent to the wastewater tank and followed under the condensate storage tank during the excavation process. The source of the contamination was believed to be the storage tank. A laboratory sample for clean closure conformation was collected under this tank. The extent of contamination was determined to be limited to the extent of the bermed containment encompassing both storage tanks, approximately 20 feet x30 feet and 16 feet in depth at the deepest point. The impacted soils were removed and land farmed at the Quinn Compressor Station. The excavation was backfilled with clean soils and the facility was rebuilt. A diagram of the excavation and analytical results are included in Attachment 2.*

Buena Vista GW-255:

Submit most recent analysis from monitoring wells. *The most recent ground water monitoring analysis is provided in Attachment 3. Ground water samples were collected quarterly between 5/96 and 5/98 with no constituents of concern detected. Included in the attachment is a letter from BR to BLM (June 25, 1998) recommending the four wells for plugging and abandonment.*

Pump Canyon GW-057:

Sign needs to be changed from Meridian to Burlington Resources. *The sign has been changed to read Burlington Resources.*

Hart Canyon GW-058:

Main compressor building sump has lost mechanical integrity. *The sump was removed and replaced with a new double walled tank with leak detection. No contamination was observed in the tank excavation. The old tank was pressure tested at the fabricators to determine the location of tank failure. The pressure test did not detect any leaks in the tank's primary or secondary walls. The old tank was determined to be in satisfactory condition and should not have been removed. A new procedure for tank integrity and leak detection testing is being developed.*

Cedar Hill GW-258:

Plant main vent system has oil accumulating on stack and system is located in stormwater drain area. *The staining was caused by hydrocarbons and water that have accumulated in the Emergency Shut Down stack between shutdowns. Shut downs are infrequent and only in an emergency. The oil staining was observed to be insignificant and unlikely to contribute to a reportable storm water release. However, the soil was cleaned and will be monitored for future stack accumulations and any resulting soil staining will be remediated.*

Middle Mesa GW-077:

1. De-hydrator steam condensate wastewater tank needs proper containment. *The tank was replace with a double walled tank.*
2. Outside west compressor-oil and water being discharged to ground. *The gravel and soil, to a depth of 6 inches, was removed around the area adjacent to the compressor skid. The remaining soil was deeply raked and a bioremediation enhancing potassium permanganate solution was applied and new gravel placed. The compressor skid was redesigned to prevent oil and water from being discharged to the ground adjacent to the compressor.*

Common action items for all sites:

1. Burlington shall make minor modifications to all discharge plans to include a routine check for emptying all sumps and troughs. *A Best Management Practice has been developed for this routine check of all sumps and containments.*
2. Burlington shall make minor modifications to all discharge plans up dating where all solid waste is being disposed of. *The discharge plans provide this information on a table in Section VIII Effluent Disposal, Part B. Off-Site Disposal.*

If you have any questions please do not hesitate to contact me at 505-326-9537.

Gobernador Waste Drain Line Test

The purpose of this Attachment is to document the successful completion of the drain line test at the Gobernador Compressor station on 11/29/00.

Background

The Gobernador Compressor Station has eight floor drains manifolded into one common 4 inch PVC drain line that flows to an outside sump tank and then to an above ground storage tank. The drain lines are below the concrete floor and collect mainly wash water and petroleum lubes and oils (POLs) generated from normal operation and maintenance of the compressor engines.

The drain lines were tested starting in April 2000 using a hydrostatic test procedure approved by OCD. The drain lines from the outside sump to the above ground storage tank and the sump inspection were tested successfully. The hydrostatic test of the drain lines from the sump to within the compressor building was unsuccessful. The drain lines inside the building failed because they were not able to hold the OCD specified static 3 p.s.i. pressure for 30 minutes. A small amount of pressure was lost during the test until a static level was achieved at ambient pressure and temperature at floor level.

To identify the cause of the test failure BR looked for any missed outlets or small cracks in the drain line that could have contribute to the loss in static pressure. Asbuilts for the station were reexamined for overlooked drain line outlets and all drain line lengths outside of the building were excavated and examined. No missed outlets or breaks in the drain lines were identified. No evidence of discharges was observed along the drain line excavated outside the building. The drain lines within the building are located under the concrete floor and surrounded by concrete and could not be excavated practically. The next step was to perform a visual inspection of the inside of the drain lines with a downhole video camera. The video determined that the condition of the inside of the drain lines was satisfactory and no obvious cracks or damage was observed.

The drain lines are constructed of PVC and designed for gravity flow at ambient pressure and are not designed to operate under pressure. It is important to note that the drain lines when hydrostatic tested are completely full of water but under normal day-to-day gravity flow conditions may only be 1/3 full. Therefore, a crack in the upper 2/3 of the drain line above normal flow height may lead to a failed hydrostatic test but no discharge under normal flow conditions.

Alternative Test

An alternative drain line test was proposed to OCD during a site inspection with Wayne Price, OCD Santa Fe and Denny Foust, OCD Aztec. The alternative test proposed was to use a specific volume in/volume out test for each segment of the drain line. A description of the procedures used to complete the volume in/volume out procedures is provided in

Attachment 1A. In addition, an assessment of the waste that could be potentially discharged by the drain lines was performed.

The volume in/volume out test recovered 100% for each drain line segment (see Table 1, Attachment 1A). The waste analysis based on pre-existing data detected no hazardous waste.

Risk Assessment

Constituent of Concern

An analysis of the products used at the compressor station determined that only POLs are collected in the drain lines at the facilities in significant quantities and no hazardous substances are permitted in the drain lines and sump system.

Under normal engine operation trace amounts of metals are contained in the used oil and these trace metals along with the POLs were identified as the primary constituents of concern for potential releases from the drain lines. Existing analysis performed to chemically profile the waste water and used oil was used to determine potential risk to the environment. The analysis of the water and the used POLs was performed for detection of metals, Flash point, and total organic halogen and volatile organic compounds. The analytical results determined that the parameters tested were below WQCC standards except for Selenium in the waste water. The Selenium concentration was measured at 0.23 mg/l and the WCCC human health standard for ground water is 0.05mg/l. The analytical results for the water and used oils are provided in Attachment 1A.

The results of the alternative volume in/volume out test demonstrated that an insignificant amount of water or none at all under normal operating conditions is lost from the drain lines

Geology and Hydrology

The receptors for potential releases from the drain line system would be the geologic materials underlying the station and to a lesser extent the ground water beneath the station. The potential for the soil contamination migrating a significant distance and subsequent ground water impacts was determined to be minor based on the following: 1) the drain lines are buried in concrete during construction further inhibiting the release of liquids; 2) the compaction necessary of the soils prior to construction of the compressor facility minimizes infiltration; 3) the 100% recovery results of the drain line volume in/volume out test completed demonstrated insignificant quantity of lost fluid; and 4) the down hole video survey not detecting significant failure in the drain line.

The soils at the Gobernador station consist of a clayey and silty sand. The underlying bedrock formation is sandstone. The cathodic well data in the area indicates the depth to groundwater to be approximately 80 feet. No groundwater was encountered during the

geotechnical test borings to a depth of 25 feet. The aquifer most likely to be affected by a potential discharge in this area is the San Juan Formation. This formation is characterized by interbedded sandstones and mudstones and is approximately 2700 ft. in total thickness. The closest ephemeral stream is the Gobernador Wash approximately ¼ mi southwest of the facility.

The migration of the POLs in the soils beneath the compressor station may be limited based on the characteristics of the POLS and the porosity of soils being fine grained and well compacted. Typically, heavier hydrocarbons do not travel far from the source without facilitated transport (i.e., head pressure) when released into fine compacted soils. Moreover, the risk to human health and the environment from the POLs may be further minimized by the natural biodegradation of the potential hydrocarbons in the soils over time. This coupled with the low hydrologic conductivity of the soils and the lack of natural precipitation to facilitate vertical transport may prevent the potential of groundwater impacts during the life of the compressor station.

Conclusion

The drain lines at the Gobernador Compressor Station present an insignificant risk to human health and the environment. This conclusion was supported by the testing and analysis results including: 1) satisfactory integrity of drain lines excavated outside the building; 2) no major findings of drain line failure using a down hole camera inspection; 3) 100% recovery results of the volume in /volume out testing under normal operation of the drain lines at ambient pressure; 4) the physical characteristics of the liquids minimizing migration; and 5) the analysis of potential constituents of concern in the waste drain line liquids.

To this end, in the unlikely event a release did occur the extent of contamination maybe small and in close proximity to the source and may never impact the groundwater. Finally, a complete remediation of the site will be performed after the decommissioning and abandonment of the station.

Attachment 1A

**Volume In/Volume Out Waste Drain Line Testing
Procedures**

Attachment 1A

Volume In/Volume Out Waste Drain Line Testing Procedures

Preparation

1. Steam clean drain lines and sump prior to test.
2. Install inlet plug with stop flow valve into sump where drain line enters sump. This will aid in the accurate collection of "volume out" water. One person will need to be inside the sump to collect water. Caution this is a confined space and the appropriate confined space permit, fresh air, safety procedures and equipment must be used.
3. Use graduated plastic buckets to accurately pour water into and capture water from drain lines.
4. Prevent the introduction of incoming fluids during the test by blocking drain lines at the source.

Test

1. Start at the furthest drain line inlet from sump. Mark volume in .01-foot increments on volume in and volume out buckets.
2. Volume In: Add 5 gallons of liquid to drain line starting at furthest drain line from sump and document time. Be careful to add water slowly and use funnel to avoid water splash loss.
3. Volume Out: At sump inlet measure return volume in graduated bucket. Allow for sufficient time (approximately 30 minutes) for water to return through drain line. Note time and volume of water collected.

Quality Assurance/Quality Control

1. Repeat one drain line segment test blind to the person collecting the "volume out" measurement inside the sump. Compare both original and repeat "volume out" measurements to document measurement precision.
2. Decrease by ½ gallon the known amount of the "volume in" water added to a randomly selected drain line segment. Do this decreased volume test blind to the person collecting the "volume out" measurement inside the sump. This check will verify "volume out" measurement accuracy

**TABLE 1 VOLUME IN/VOLUME OUT TEST RESULTS
GOBERNADOR COMPRESSOR STATION**

SAN JUAN DIVISION

June 25, 1998

Dale L. Wirth
Bureau of Land Management
1235 La Plata Highway
Farmington, New Mexico 87401

**Re: Buena Vista Compressor Station
Groundwater Sampling Event**

Dear Mr. Wirth:

Burlington Resources Oil and Gas Inc. (BR) is supplying you with a copy of the final Buena Vista Compressor Station Semi-Annual Report for Groundwater Sampling. The final sampling event took place on May 20, 1998. As with the previous sampling, laboratory results indicated that all tested parameters were below laboratory detection limits, except total dissolved solids.

All groundwater sampling was done to meet the Buena Vista Environmental Assessment Requirements. Now that these requirements have been met, BR recommends plugging and abandoning the four monitoring wells. Please respond in writing indicating your concurrence.

If you have any questions regarding this submittal, please contact me at (505) 326-9841.

Sincerely,

Ed Hasely
Sr. Staff Environmental Representative

Buena Vista C.S. Facility File

ATTACHMENT TO THE DISCHARGE PLAN GW-056 APPROVAL
Burlington Resources, Gobernador Compressor Station
DISCHARGE PLAN APPROVAL CONDITIONS
October 27, 2000

1. Payment of Discharge Plan Fees: The \$50.00 filing fee has been received by the OCD. There is a required flat fee equal to one-half of the original flat fee for natural gas compressor stations with horsepower rating above 3000 horsepower. The renewal flat fee required for this facility is \$690.00 which may be paid in a single payment due at the time of approval, or in equal annual installments over the duration of the discharge plan, with the first payment due upon receipt of this approval. The filing fee is payable at the time of application and is due upon receipt of this approval.
2. Commitments: Burlington Resources will abide by all commitments submitted in the discharge plan renewal application dated June 29, 2000 including attachments, and these conditions for approval.
3. Drum Storage: All drums containing materials other than fresh water must be stored on an impermeable pad with curbing. All empty drums should be stored on their sides with the bungs in place and lined up on a horizontal plane. Chemicals in other containers such as sacks or buckets must also be stored on an impermeable pad with curbing.
4. Process Areas: All process and maintenance areas which show evidence that leaks and spills are reaching the ground surface must be either paved and curbed or have some type of spill collection device incorporated into the design.
5. Above Ground Tanks: All above ground tanks which contain fluids other than fresh water must be bermed to contain a volume of one-third more than the total volume of the largest tank or of all interconnected tanks. All new facilities or modifications to existing facilities must place the tank on an impermeable type pad within the berm.
6. Above Ground Saddle Tanks: Above ground saddle tanks must have impermeable pad and curb type containment unless they contain fresh water or fluids that are gases at atmospheric temperature and pressure.
7. Labeling: All tanks, drums, and other containers should be clearly labeled to identify their contents and other emergency information necessary if the tank were to rupture, spill, or ignite.

8. Below Grade Tanks/Sumps: All below grade tanks, sumps, and pits must be approved by the OCD prior to installation or upon modification and must incorporate secondary containment and leak-detection into the design. All pre-existing sumps and below-grade tanks must be tested to demonstrate their mechanical integrity no later than December 15, 2000 and every year from tested date, thereafter. Permittees may propose various methods for testing such as pressure testing to 3 pounds per square inch above normal operating pressure and/or visual inspection of cleaned out tanks and/or sumps, or other OCD approved methods. The OCD will be notified at least 72 hours prior to all testing. The test results will be submitted to OCD by December 31, 2000.
- 9.* Underground Process/Wastewater Lines: All underground process/wastewater pipelines must be tested to demonstrate their mechanical integrity no later than December 15, 2000 and every 5 years, from tested date, thereafter. Permittees may propose various methods for testing such as pressure testing to 3 pounds per square inch above normal operating pressure or other means acceptable to the OCD. The OCD will be notified at least 72 hours prior to all testing. The test results will be submitted to OCD by December 31, 2000.
10. Class V Wells: No Class V wells that inject non-hazardous industrial wastes or a mixture of industrial wastes and domestic wastes will be approved for construction and/or operation unless it can be demonstrated that groundwater will not be impacted in the reasonably foreseeable future. Leach fields and other wastewater disposal systems at OCD regulated facilities which inject non-hazardous fluid into or above an underground source of drinking water are considered Class V injection wells under the EPA UIC program. Class V wells that inject domestic waste only must be permitted by the New Mexico Environment Department.
11. Housekeeping: All systems designed for spill collection/prevention, and leak detection will be inspected daily to ensure proper operation and to prevent over topping or system failure. All spill collection and/or secondary containment devices will be emptied of fluids within 48 hours of discovery.
12. Spill Reporting: All spills/releases shall be reported pursuant to OCD Rule 116. and WQCC 1203. to the OCD Aztec District Office.
13. Waste Disposal: All wastes will be disposed of at an OCD approved facility. Only oilfield exempt wastes shall be disposed of down Class II injection wells. Non-exempt oilfield wastes that are non-hazardous may be disposed of at an OCD approved facility upon proper waste determination per 40 CFR Part 261. Any waste stream that is not listed in the discharge plan will be approved by OCD on a case-by-case basis.

* Process lines do not include, gas supply lines

14. OCD Inspections: Additional requirements may be placed on the facility based upon results from OCD inspections.
15. Storm Water Plan: Burlington Resources shall maintain stormwater runoff controls as submitted in the discharge plan item IX. B. "Precipitation/Stormwater Runoff Control." As a result of Burlington's operations if any water contaminant that exceeds the WQCC standards listed in 20 NMAC 6.2.3101 is discharged in any stormwater run-off then Burlington shall notify the OCD within 24 hours, modify the plan within 15 days and submit for OCD approval. Burlington shall also take immediate corrective actions pursuant to Item 12 of these conditions.
16. Transfer of Discharge Plan: The OCD will be notified prior to any transfer of ownership, control, or possession of a facility with an approved discharge plan. A written commitment to comply with the terms and conditions of the previously approved discharge plan must be submitted by the purchaser and approved by the OCD prior to transfer.
17. Closure: The OCD will be notified when operations of the facility are discontinued for a period in excess of six months. Prior to closure of the facility a closure plan will be submitted for approval by the Director. Closure and waste disposal will be in accordance with the statutes, rules and regulations in effect at the time of closure.
18. Certification: **Burlington Resources** by the officer whose signature appears below, accepts this permit and agrees to comply with all terms and conditions contained herein. **Burlington Resources** further acknowledges that these conditions and requirements of this permit may be changed administratively by the Division for good cause shown as necessary to protect fresh water, human health and the environment.

**Re: Discharge Plan Renewal GW-056
Gobernador Compressor Station**

Dear Mr. Anderson,

Thank you for the response and approval of the Discharge Plan renewal application GW-056 for the Burlington Resources Gathering Inc. (BR) Gobernador Compressor Station located in the NW/4, NW/4 of Section 31, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico.

As per your request, BR is providing a signed copy of the Discharge Plan Approval Conditions (Attachment 1) and a renewal flat fee of \$690.00 for natural gas compressor stations with horsepower ratings above 3000 horsepower.

If you have questions or need additional information regarding this issue please contact me at (505) 326-9537.

Sincerely,

Gregg Wurtz
Sr. Environmental Representative

RE: Site Inspections

Dear Mr. Wurtz:

New Mexico Oil Conservation Division (OCD) recently conducted site inspections of several Burlington Resources (BR) compressor stations that currently have discharge plan permits. Please find enclosed a copy of these inspection reports including photos for your files. Below is a summary of action items required to be addressed by Burlington Resources:

Manzanares GW-059:

1. Discharge of oil from the compressors are being deposited on the ground. (see picture #2)
2. Oil stain found around waste water tank. (see picture #3)

Gobernador GW-056:

1. Compressor building drain line will not hold pressure.

Pump Mesa GW-148:

1. Oil stain around produced water tank. (see picture #2)
2. Oil stain around compressor sump. (see picture #3)

Quinn GW-239:

1. TEG and De-hydrator waste water tank secondary liner is torn. (see picture #2)

Sandstone GW-193:

1. Tank farm area- lube oil pump is leaking and produced water tank is wet around base.

Rattlesnake GW-093:

1. Motor oil and anti-freeze storage tanks do not have proper containment.
2. Oil and water observed in condensate underground wastewater storage tank leak detector. (see picture 2&3)

Bunea Vista GW-255:

1. Submit most recent analysis from monitoring wells.

Pump Canyon GW-057:

1. Sign needs to be changed from Meridian to Burlington Resources. (see picture #1)

Hart Canyon GW-058:

1. Main Compressor sump has lost mechanical integrity. (see picture #3)

Cedar Hill GW-258:

1. Plant main vent system has oil accumulating on stack and system is located in stormwater drain area. (see picture #2)

Middle Mesa GW-077:

1. De-hydrator steam condensate wastewater tank needs proper containment. (see picture #2)
2. Outside west compressor-oil and water being discharged to ground. (see picture #3)

Common action items for all sites:

1. Burlington shall make minor modifications to all discharge plans to include a routine check for emptying all sumps and troughs.
2. Burlington shall make minor modifications to all discharge plans up dating where all solid waste is being disposed of.

Mr. Greg Wurtz
11/14/00
page 3

Please provide a detail report for each action item listed above showing your corrective actions taken and/or findings by January 15, 2001.

If you have any questions please do not hesitate to call me at 505-827-7155.

Sincerely;

A handwritten signature in black ink, appearing to read 'Wayne Price', with a long horizontal flourish extending to the right.

DISCHARGE PLAN APPLICATION FOR SERVICE COMPANIES, GAS PLANTS, REFINERIES, COMPRESSOR, AND CRUDE OIL PUMP STATIONS

(Refer to the OCD Guidelines for assistance in completing the application)

New Renewal Modification

1. Type: GOVERNADOR COMPRESSOR STATION
2. Operator: BURLINGTON RESOURCES, INC.
Address: P.O. BOX 4289, Farmington New Mexico 87 499-4289
Contact Person: Gregg Wurtz Phone: (505)326-9537
3. Location: NW /4 NW /4 Section 31 Township 30N Range 7W
Submit large scale topographic map showing exact location.
4. Attach the name, telephone number and address of the landowner of the facility site.
5. Attach the description of the facility with a diagram indicating location of fences, pits, dikes and tanks on the facility.
6. Attach a description of all materials stored or used at the facility.
7. Attach a description of present sources of effluent and waste solids. Average quality and daily volume of waste water must be included.
8. Attach a description of current liquid and solid waste collection/treatment/disposal procedures.
9. Attach a description of proposed modifications to existing collection/treatment/disposal systems.
10. Attach a routine inspection and maintenance plan to ensure permit compliance.
11. Attach a contingency plan for reporting and clean-up of spills or releases.
12. Attach geological/hydrological information for the facility. Depth to and quality of ground water must be included.
13. Attach a facility closure plan, and other information as is necessary to demonstrate compliance with any other OCD rules, regulations and/or orders.
14. CERTIFICATION I hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

**GOBERNADOR COMPRESSOR STATION
DISCHARGE PLAN**

I. TYPE OF OPERATION

Gobernador Compressor Station (Gobernador) is a natural gas compressor station, which receives lean gas via an upstream gas gathering system. At this facility the gas is compressed to an intermediate pressure.

II. OPERATOR AND LOCAL REPRESENTATIVE

A. Operator

Name: Burlington Resources, Inc.	Address: P. O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: 505-326-9700

B. Local Representative

Name: Gregg Wurtz	Address: P. O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: 505-326-9537

III. FACILITY LOCATION

Township: T 30N	Range: R7W	Section: S 31 NW 1/4	County: Rio Arriba
------------------------	-------------------	-----------------------------	---------------------------

A topographic map of the area is attached as Figure 1, Facility Area Map.

IV. LANDOWNERS

Name: BLM	Address: 1235 La Plata Hwy.
City: Farmington	State: New Mexico
Zip: 87499	Phone: (505) 599 - 8900
Name: Burlington Resources	Address: P.O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: (505) 326 - 9700

V. FACILITY DESCRIPTION

The Gobernador Compressor Station is constructed on a pad of approximately 6.35 acres in size. It consists of four gas compression engines (2650 hp each), and the following tanks and sumps:

Container Type	Capacity	Product	Construction Material	Location
Tank	210 barrel	Lube Oil	Steel	Above ground
Tank	210 barrel	Used Oil	Steel	Above ground
Tank	210 barrel	Ethylene glycol (EG)	Steel	Above ground
Tank	210 barrel	Produce Water	Steel	Above ground
Tank	210 barrel	Fresh Water	Steel	Above ground
Process Sump	375 gallon	Oil, EG, Water	Steel	Below ground

The attached Figure 2 illustrates the overall facility layout and equipment components.

VI. SOURCES, QUANTITIES & QUALITY OF EFFLUENTS

A. Waste Stream Data

Source of Waste	Type of Waste	Volume/Month	Type/Volume of Additives	Collection System/Storage
Compressor Engines	Cooling Water	Intermittent	Ethylene Glycol (EG)	Drums
Compressor Engines	Leaks	Intermittent	EG, Oil, Water	Sump
Compressor Engines	Used Oil	1200 gallons	None	Aboveground steel tank
Compressor Engines	Oil Filters	31 filters	None	Container/bin
Inlet Filter Separator	Inlet Filters	84 filters per year	None	Container/bin
Slug Catcher Inlet Separator	Produced Water	20 barrels	Corrosion Inhibitors	Aboveground steel tank
Trash	Solid Waste	1-2 Containers	None	Container/bin

B. Quality Characteristics

1. Note that there are no process waste stream discharges from Gobernador to the ground surface. Waste streams are contained and their disposition is described in Section VIII.
2. Chemical analysis has not been performed on any of the waste streams because they are not disposed of on-site as an "effluent." Produced water from the inlet filter separator may contain the BETX hydrocarbon compounds listed in

WQCC 1- 101.ZZ. Similarly, used oil collected in the sump will contain the WQCC 1- 101.ZZ hydrocarbon compounds.

C. Commingled Waste Streams

1. Produced water from the inlet scrubbers and filter separator may be commingled prior to being hauled for disposal. In addition, wash water (fresh water) and drips and/or leaks (de minimus quantities) from compressors, compressor engines, elevated oil lube tanks may be introduced into the sump during maintenance operations.

VII. TRANSFER & STORAGE OF PROCESS FLUIDS & EFFLUENTS

A. Storage

Information on the waste stream collection and storage containers is summarized in the tables in Sections V and VI.

B. Flow Schematics

The individual "treatment" units are shown on Figure 2. Produced water may be generated during the compression of gas with water being diverted to an aboveground tank.

C. Surface and Subsurface Discharge Potential

1. The table in Section V provides a listing of all aboveground tanks and below grade sumps. Pressurized pipelines carry the compressed gas through the station to the outlet meter run.
2. Used compressor lube oil and engine crankcase oil is pumped into the 210 barrel used oil tank. Drips and minor leaks (de minimus quantities) from the compressors, compressor engines and elevated lube oil tank may drain into the sump. Fluids collected in the sump are periodically transferred to the 210 bbl above ground storage tank for disposal (see Section VIII).
3. The size and construction material of the collection units is described in the table in section V.

D. NMOCD Design Criteria

1. The 210 bbl tanks (used oil tank, EG tank, and lube oil tank) are located in a 101' x 39' x 4' bermed area. The tanks are placed on a plastic liner and gravel and are surrounded at the base by a steel ring. Any leak in the tanks will be identified in the area outside of the steel ring. Capacity of the bermed areas meets the general engineering practice of one and one third times the capacity of the largest tank. Each of the five tanks are independent and are not connected together by a common manifold.
2. Drums may be temporarily used or stored on location. The drums are stored within the compressor building that has containment or on a curbed containment. To reduce the risk of spilled process fluids from contacting the ground surface, BR has constructed curbed concrete or containment around process equipment with a higher probability of a spill/leak.
3. The below ground sump complies with OCD specifications. Sump is equipped with double walls and a leak detection system that provides a discrete alarm which can be viewed and monitored through the stations telemetry system 24 hours per day.
4. The installation of the 210 bbl produced water storage tanks has been constructed on a 6" gravel pack, contained in a steel ring. Any leak in the tanks will be identified in the area outside of the steel ring.
5. An impermeable bermed containment will be installed if a major modification to the existing tank battery occurs and the potential for a release to the environment exists. BR will consider the replacement of a single tank within a multiple tank battery a minor modification. A major modification may include but is not limited to replacing the entire tank battery or increasing tank volume substantially.

E. Underground Pipelines and Below Grade Sumps

The mechanical integrity testing of the underground wastewater pipelines is performed once every 5 years from the date of permit renewal approval. The mechanical integrity of the below grade sumps is performed annually. NMOCD will be notified 72 hours prior to performing the testing.

F. Proposed Modifications

The existing site conditions at Gobernador provide protection from present or future ground water contamination. All plant processes are closed pipes, contained in tanks, or otherwise controlled to prevent leakage. No additional modifications are proposed at this time.

VIII. EFFLUENT DISPOSAL

A. On-Site Disposal

The Control Room is equipped with a toilet and sink, and uses an 800-gallon septic tank with a 300 sq. ft. constructed leach field adjacent to the motor control center.

B. Off-Site Disposal

The following table provides information about off-site waste disposal:

Waste Stream	Shipment Method	Shipping Agent	Final Disposition	Receiving Facility
Produced Water	Truck	<i>See Note 1</i>	Class II Well	<i>See Note 2</i>
Inlet Separator, Used Oil, TEG and Fuel Gas Filters	Truck	<i>See Note 3</i>	Filters are landfilled	Waste Management C/R 3100 Aztec, NM
Engine coolant	Truck	<i>See Note 3</i>	Recycled	<i>See Note 3</i>
Used Oil	Truck	<i>See Note 1</i>	Recycled	Safety-Kleen 4210 A Hawkins Rd Farmington, NM
Solid Waste (Trash/Refuse)	Truck	Waste Management C/R 3100 Aztec, NM	Landfill	Waste Management C/R 3100 Aztec, NM

Note 1: The trucking agent contracted to ship effluents off-site will be one of the following:

Dawn Trucking Co. 318 Hwy. 64 Farmington, New Mexico.	Key Trucking 708 S. Tucker Ave. Farmington, New Mexico	Safety-Kleen 4210 A Hawkins Rd Farmington, NM
---	--	---

Note 2: The off-site Disposal Facility will be one of the following:

McGrath SWD #4 Sec. 34, T-30-N, R-12-W San Juan County New Mexico	Basin Disposal Sec. 3, T-29-N, R-11-W 6 County Rd 5046 Bloomfield, New Mexico	Key Disposal Sec. 2, T-29-N, R-12-W 323 County Rd. 3500 Farmington, New Mexico
--	--	---

Note 3: The shipping agent for this material will be one of the following companies:

Envirotech 5796 US Hwy. 64 Farmington, New Mexico	Waste Management Road 3100 Aztec, New Mexico	Tierra Environmental Sec 2, T29N, R12W San Juan Co., NM	Coastal Chemical Co. 10 Road 5911 Farmington, NM
---	--	---	--

C. Proposed Modifications

The existing site conditions at Gobernador provide protection from present or future ground water contamination. No additional modifications are proposed at this time.

IX. INSPECTION, MAINTENANCE AND REPORTING

A. Leak Detection/Site Visits

The below ground sump is equipped with double walls and a leak detection system that provides a discrete alarm which can be viewed through the stations telemetry system.

Daily log sheets are filled out along with routine visual inspection of facility equipment and continuous monitoring of process instrumentation are performed to identify possible leaks.

Should a release of materials occur, BR will comply in accordance with provisions described in NMOCD Rule and Regulation #116 and WQCC section 1-203.

B. Precipitation/Stormwater Runoff Control

Exposure minimization practices are used to lessen the potential for storm water to come into contact with process and waste streams. Consequently, storm water run-off does not come in contact with process and waste streams. Precipitation that contacts the process equipment is contained within bermed or containment areas and allowed to evaporate. The facility pad is maintained and where necessary armored with gravel to minimize erosion and prevent surface accumulations. Open top tanks are inspected periodically to monitor fluid levels.

A storm water plan is not a requirement of the EPA (Federal; Register/Vol. 55 No. 22, Friday, November 16, 1990). A storm water permit is necessary only if a facility has had a release of a reportable quantity of oil or a hazardous substance in storm water in the last three years. The Gobernador Compressor Station has not had a release of a reportable quantity to date.

C. General Maintenance

A log documenting spill collection/prevention is maintained as part of a daily log of the station operator's activities and maintenance work. The log specifically addresses compressor maintenance, however the operator does inspect the general facility and the station's systems for spill collection /prevention on a routine basis. Maintenance findings are noted in a logbook and corrective action is documented.

X. SPILL/LEAK PREVENTION & REPORTING

A. Spill/Leak Potential

Potential sources of spills or leaks at this facility include the following:

1. Tank overflow or rupture;
2. Overflow or cracking of concrete sumps;
3. Rupture of process pipelines.
4. Pigging operations

Prevention of accidental releases from these sources is a high priority of Burlington Resources, Inc. (BR). Spill prevention is achieved primarily through proper execution of operating procedures and secondly, by an active equipment inspection and maintenance program. Spill detection is accomplished by routine visual inspection of facility equipment and continuous monitoring of process instrumentation.

To reduce the risk of spilled process fluids from contacting the ground surface, BR has constructed curbed concrete or containment around process equipment with a higher probability of a spill/leak. Process and maintenance areas are paved and curbed or have spill collection controls implemented if a reoccurring long term pattern of significant spills or leaks is identified that can not be remediated by general clean up procedures. Incidental leaks or process/maintenance spills that are adequately remediated are not considered significant.

B. Spill/Leak Control

General spill cleanup procedures may involve minor earthwork to prevent migration, and recovery of as much free liquid as possible. Recovered fluids would then be transported off-site for recycling or disposal. Clean up procedures by BR will follow OCD Guidelines for Remediation of Leaks, Spills and Releases.

C. Spill/Leak Reporting

Should a release of materials occur, BR will comply in accordance with provisions described in NMOCD Rule and Regulation #116 and WQCC Section 1-203.

XI. SITE CHARACTERISTICS

Much of the information used for this section was obtained from New Mexico Bureau of Mines and Mineral Resources publications and a geotechnical report written for BR by Western Technologies Inc. in December of 1989. The report was generated to document physical characteristics of soils in the area of Gobernador for the purposes of construction. Documentation of the soils involved drilling two boreholes to 25' in depth,

classifying and logging each soil type as it was encountered. The geotechnical survey is not included with this discharge plan.

A. Hydrologic Features

1. Gobernador Wash runs along the southwest edge of the site. There are several named and unnamed surface waters within a one mile area of the station including (Gobernador wash, NAPA irrigation canal, and stock ponds). The site generally slopes to the southwest.
2. Cathodic well data in the area indicates the depth to ground water to be approximately 80 feet. No ground water was encountered during test borings for the geotechnical survey.
3. Ground water flow direction is likely to be south southwest, based on a review of topographic features at the site. This would be consistent with an existing wash/arroyo which runs along the southwest edge of the site.

B. Geologic Description of Site

- 1 The soil consist of clayey and silty sand with a low to moderate load bearing capabilities. The underlying materials consist of sandstone of moderate to high load bearing capabilities.
2. The aquifer most likely to be affected by a discharge in this area is the San Jose Formation. Total Dissolved Solids (TDS) of water from this formation is estimated to be greater than 1700 mg/l on an avg.(New Mexico Bureau of Mines and Mineral Resources, 1983).
3. This formation is characterized by interbedded sandstone and mudstones. The thickness of the formation ranges up to nearly 2,700 feet, in the basin between Cuba and Gobernador. (New Mexico Bureau of Mines and Mineral Resources, 1983).
4. Depth to the top of bedrock strata was not encountered during test borings (Western Technologies Inc. Geotechnical Report)

C. Flood Protection

Gobernador lies approximately 5.5 miles to the east of the San Juan River. This area is not typically subject to flooding therefore special flood protection measures are not needed.

XII. ADDITIONAL INFORMATION

As stated previously, this facility does not intentionally discharge or dispose of any waste on-site. Containment devices are installed and regularly inspected to insure proper operation. As a result, BR has demonstrated that approval of this plan will not result in concentrations in excess of the standards of Section 3-103 or the presence of any toxic pollutant at any place of withdrawal of water for present or reasonably foreseeable future use.

XIII. AFFIRMATION

"I hereby certify that I am familiar with the information contained in and submitted with this discharge plan, and that such information is true, accurate, and complete to the best of my knowledge and belief."

NOTICE OF PUBLICATION

**STATE OF NEW MEXICO
ENERGY, MINERALS AND
NATURAL RESOURCES
DEPARTMENT
OIL CONSERVATION
DIVISION**

Notice is hereby given that pursuant to New Mexico Water Quality Control Commission Regulations, the following discharge plan applications have been submitted to the Director of the Oil Conservation Division, 2040 South Pacheco, Santa Fe, New Mexico 87505, Telephone (505) 827-7131:

(GW-056) - Burlington Resources, Greg Wurtz, Environmental Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted a discharge plan renewal application for their Gobernador Natural Gas Compressor Station located in the NW/4 NW/4 of Section 31, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico. Natural gas products, waste oil and water is stored in above ground tanks prior to being transported off-site to OCD approved facilities. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 80 feet with an estimated total dissolved solids concentration of approximately 1700 mg/L. The discharge plan addresses how oilfield products and waste will be properly handled, stored, and disposed of, including how spills, leaks and other accidental discharges to the surface will be managed in order to protect fresh water.

(GW-058) - Burlington Resources, Greg Wurtz, En-

vironmental Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted a discharge plan renewal application for their Hart Canyon Natural Gas Compressor Station located in the NW/4 SE/4 of Section 20, Township 31 North, Range 10 West, NMPM, San Juan County, New Mexico. Natural gas products, waste oil and water is stored in above ground tanks prior to being transported off-site to OCD approved facilities. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 130 feet with an estimated total dissolved solids concentration of approximately 1700 mg/L. The discharge plan addresses how oilfield products and waste will be properly handled, stored, and disposed of, including how spills, leaks and other accidental discharges to the surface will be managed in order to protect fresh water.

(GW-059) - Burlington Resources, Greg Wurtz, Environmental Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted a discharge plan renewal application for their Manzaneros Natural Gas Compressor Station located in the SW/4 SE/4 of Section 4, Township 29 North, Range 8 West, NMPM, San Juan County, New Mexico. Natural gas products, waste oil and water is stored in above ground tanks prior to being transported off-site to OCD approved facilities. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 211 feet with an estimated total dissolved solids concentration of approximately 1700 mg/L. The discharge plan addresses how oilfield products and

waste will be properly handled, stored, and disposed of, including how spills, leaks and other accidental discharges to the surface will be managed in order to protect fresh water.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge plan application may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday through Friday. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and public hearing may be requested by any interested person. Requests for public hearing shall set forth the reasons why a hearing shall be held. A hearing will be held if the Director determines there is significant public interest.

If no hearing is held, the Director will approve or disapprove the proposed plan based on the information available. If a public hearing is held, the Director will approve the proposed plan based on the information in the discharge plan application and information submitted at the hearing.

GIVEN under the Seal of New Mexico Conservation Commission at Santa Fe, New Mexico, on this 8th day of August, 2000.

DISCHARGE PLAN APPLICATION FOR SERVICE COMPANIES, GAS PLANTS, REFINERIES, COMPRESSOR, AND CRUDE OIL PUMP STATIONS

(Refer to the OCD Guidelines for assistance in completing the application)

New Renewal Modification

1. Type: GOVERNADOR COMPRESSOR STATION
2. Operator: BURLINGTON RESOURCES, INC.
Address: P.O. BOX 4289, Farmington New Mexico 87 499-4289
Contact Person: Gregg Wurtz Phone: (505)326-9537
3. Location: NW /4 NW /4 Section 31 Township 30N Range 7W
Submit large scale topographic map showing exact location.
4. Attach the name, telephone number and address of the landowner of the facility site.
5. Attach the description of the facility with a diagram indicating location of fences, pits, dikes and tanks on the facility.
6. Attach a description of all materials stored or used at the facility.
7. Attach a description of present sources of effluent and waste solids. Average quality and daily volume of waste water must be included.
8. Attach a description of current liquid and solid waste collection/treatment/disposal procedures.
9. Attach a description of proposed modifications to existing collection/treatment/disposal systems.
10. Attach a routine inspection and maintenance plan to ensure permit compliance.
11. Attach a contingency plan for reporting and clean-up of spills or releases.
12. Attach geological/hydrological information for the facility. Depth to and quality of ground water must be included.
13. Attach a facility closure plan, and other information as is necessary to demonstrate compliance with any other OCD rules, regulations and/or orders.
14. CERTIFICATION I hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

Re: Discharge Plan Renewal (GW-056) Gobernador Compressor Station

Dear Mr. Anderson:

As per the New Mexico Oil Conservation Division's request, Burlington Resources, Inc. (BR) is submitting the attached Gobernador Station Discharge Plan Renewal (GW-056).

Thank you for your time in reviewing this discharge plan. If I can be of further assistance, please contact me at (505) 326-9537.

Sincerely,

Gregg Wurtz
Senior Environmental Representative

GOBERNADOR COMPRESSOR STATION DISCHARGE PLAN

I. TYPE OF OPERATION

Gobernador Compressor Station (Gobernador) is a natural gas compressor station, which receives lean gas via an upstream gas gathering system. At this facility the gas is compressed to an intermediate pressure.

II. OPERATOR AND LOCAL REPRESENTATIVE

A. Operator

Name: Burlington Resources, Inc.	Address: P. O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: 505-326-9700

B. Local Representative

Name: Gregg Wurtz	Address: P. O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: 505-326-9537

III. FACILITY LOCATION

Township: T 30N	Range: R7W	Section: S 31 NW 1/4	County: Rio Arriba
-----------------	------------	----------------------	--------------------

A topographic map of the area is attached as Figure 1, Facility Area Map.

IV. LANDOWNERS

Name: BLM	Address: 1235 La Plata Hwy.
City: Farmington	State: New Mexico
Zip: 87499	Phone: (505) 599 - 8900
Name: Burlington Resources	Address: P.O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: (505) 326 - 9700

V. FACILITY DESCRIPTION

The Gobernador Compressor Station is constructed on a pad of approximately 6.35 acres in size. It consists of four gas compression engines (2650 hp each), and the following tanks and sumps:

Container Type	Capacity	Product	Construction Material	Location
Tank	210 barrel	Lube Oil	Steel	Above ground
Tank	210 barrel	Used Oil	Steel	Above ground
Tank	210 barrel	Ethylene glycol (EG)	Steel	Above ground
Tank	210 barrel	Produce Water	Steel	Above ground
Tank	210 barrel	Fresh Water	Steel	Above ground
Process Sump	375 gallon	Oil, EG, Water	Steel	Below ground

The attached Figure 2 illustrates the overall facility layout and equipment components.

VI. SOURCES, QUANTITIES & QUALITY OF EFFLUENTS

A. Waste Stream Data

Source of Waste	Type of Waste	Volume/Month	Type/Volume of Additives	Collection System/Storage
Compressor Engines	Cooling Water	Intermittent	Ethylene Glycol (EG)	Drums
Compressor Engines	Leaks	Intermittent	EG, Oil, Water	Sump
Compressor Engines	Used Oil	1200 gallons	None	Aboveground steel tank
Compressor Engines	Oil Filters	31 filters	None	Container/bin
Inlet Filter Separator	Inlet Filters	84 filters per year	None	Container/bin
Slug Catcher Inlet Separator	Produced Water	20 barrels	Corrosion Inhibitors	Aboveground steel tank
Trash	Solid Waste	1-2 Containers	None	Container/bin

B. Quality Characteristics

1. Note that there are no process waste stream discharges from Gobernador to the ground surface. Waste streams are contained and their disposition is described in Section VIII.
2. Chemical analysis has not been performed on any of the waste streams because they are not disposed of on-site as an "effluent." Produced water from the inlet filter separator may contain the BETX hydrocarbon compounds listed in

WQCC 1- 101.ZZ. Similarly, used oil collected in the sump will contain the WQCC 1- 101.ZZ hydrocarbon compounds.

C. Commingled Waste Streams

1. Produced water from the inlet scrubbers and filter separator may be commingled prior to being hauled for disposal. In addition, wash water (fresh water) and drips and/or leaks (de minimus quantities) from compressors, compressor engines, elevated oil lube tanks may be introduced into the sump during maintenance operations.

VII. TRANSFER & STORAGE OF PROCESS FLUIDS & EFFLUENTS

A. Storage

Information on the waste stream collection and storage containers is summarized in the tables in Sections V and VI.

B. Flow Schematics

The individual "treatment" units are shown on Figure 2. Produced water may be generated during the compression of gas with water being diverted to an aboveground tank.

C. Surface and Subsurface Discharge Potential

1. The table in Section V provides a listing of all aboveground tanks and below grade sumps. Pressurized pipelines carry the compressed gas through the station to the outlet meter run.
2. Used compressor lube oil and engine crankcase oil is pumped into the 210 barrel used oil tank. Drips and minor leaks (de minimus quantities) from the compressors, compressor engines and elevated lube oil tank may drain into the sump. Fluids collected in the sump are periodically transferred to the 210 bbl above ground storage tank for disposal (see Section VIII).
3. The size and construction material of the collection units is described in the table in section V.

D. NMOCD Design Criteria

1. The 210 bbl tanks (used oil tank, EG tank, and lube oil tank) are located in a 101' x 39' x 4' bermed area. The tanks are placed on a plastic liner and gravel and are surrounded at the base by a steel ring. Any leak in the tanks will be identified in the area outside of the steel ring. Capacity of the bermed areas meets the general engineering practice of one and one third times the capacity of the largest tank. Each of the five tanks are independent and are not connected together by a common manifold.
2. Drums may be temporarily used or stored on location. The drums are stored within the compressor building that has containment or on a curbed containment. To reduce the risk of spilled process fluids from contacting the ground surface, BR has constructed curbed concrete or containment around process equipment with a higher probability of a spill/leak.
3. The below ground sump complies with OCD specifications. Sump is equipped with double walls and a leak detection system that provides a discrete alarm which can be viewed and monitored through the stations telemetry system 24 hours per day.
4. The installation of the 210 bbl produced water storage tanks has been constructed on a 6" gravel pack, contained in a steel ring. Any leak in the tanks will be identified in the area outside of the steel ring.
5. An impermeable bermed containment will be installed if a major modification to the existing tank battery occurs and the potential for a release to the environment exists. BR will consider the replacement of a single tank within a multiple tank battery a minor modification. A major modification may include but is not limited to replacing the entire tank battery or increasing tank volume substantially.

E. Underground Pipelines and Below Grade Sumps

The mechanical integrity testing of the underground wastewater pipelines is performed once every 5 years from the date of permit renewal approval. The mechanical integrity of the below grade sumps is performed annually. NMOCD will be notified 72 hours prior to performing the testing.

F. Proposed Modifications

The existing site conditions at Gobernador provide protection from present or future ground water contamination. All plant processes are closed pipes, contained in tanks, or otherwise controlled to prevent leakage. No additional modifications are proposed at this time.

VIII. EFFLUENT DISPOSAL

A. On-Site Disposal

The Control Room is equipped with a toilet and sink, and uses an 800-gallon septic tank with a 300 sq. ft. constructed leach field adjacent to the motor control center.

B. Off-Site Disposal

The following table provides information about off-site waste disposal:

Waste Stream	Shipment Method	Shipping Agent	Final Disposition	Receiving Facility
Produced Water	Truck	<i>See Note 1</i>	Class II Well	<i>See Note 2</i>
Inlet Separator, Used Oil, TEG and Fuel Gas Filters	Truck	<i>See Note 3</i>	Filters are landfilled	Waste Management C/R 3100 Aztec, NM
Engine coolant	Truck	<i>See Note 3</i>	Recycled	<i>See Note 3</i>
Used Oil	Truck	<i>See Note 1</i>	Recycled	Safety-Kleen 4210 A Hawkins Rd Farmington, NM
Solid Waste (Trash/Refuse)	Truck	Waste Management C/R 3100 Aztec, NM	Landfill	Waste Management C/R 3100 Aztec, NM

Note 1: The trucking agent contracted to ship effluents off-site will be one of the following:

Dawn Trucking Co. 318 Hwy. 64 Farmington, New Mexico.	Key Trucking 708 S. Tucker Ave. Farmington, New Mexico	Safety-Kleen 4210 A Hawkins Rd Farmington, NM
---	--	---

Note 2: The off-site Disposal Facility will be one of the following:

McGrath SWD #4 Sec. 34, T-30-N, R-12-W San Juan County New Mexico	Basin Disposal Sec. 3, T-29-N, R-11-W 6 County Rd 5046 Bloomfield, New Mexico	Key Disposal Sec. 2, T-29-N, R-12-W 323 County Rd. 3500 Farmington, New Mexico
--	--	---

Note 3: The shipping agent for this material will be one of the following companies:

Envirotech 5796 US Hwy. 64 Farmington, New Mexico	Waste Management Road 3100 Aztec, New Mexico	Tierra Environmental Sec 2, T29N, R12W San Juan Co., NM	Coastal Chemical Co. 10 Road 5911 Farmington, NM
---	--	---	--

C. Proposed Modifications

The existing site conditions at Gobernador provide protection from present or future ground water contamination. No additional modifications are proposed at this time.

IX. INSPECTION, MAINTENANCE AND REPORTING

A. Leak Detection/Site Visits

The below ground sump is equipped with double walls and a leak detection system that provides a discrete alarm which can be viewed through the stations telemetry system.

Daily log sheets are filled out along with routine visual inspection of facility equipment and continuous monitoring of process instrumentation are performed to identify possible leaks.

Should a release of materials occur, BR will comply in accordance with provisions described in NMOCD Rule and Regulation #116 and WQCC section 1-203.

B. Precipitation/Stormwater Runoff Control

Exposure minimization practices are used to lessen the potential for storm water to come into contact with process and waste streams. Consequently, storm water run-off does not come in contact with process and waste streams. Precipitation that contacts the process equipment is contained within bermed or containment areas and allowed to evaporate. The facility pad is maintained and where necessary armored with gravel to minimize erosion and prevent surface accumulations. Open top tanks are inspected periodically to monitor fluid levels.

A storm water plan is not a requirement of the EPA (Federal; Register/Vol. 55 No. 22, Friday, November 16, 1990). A storm water permit is necessary only if a facility has had a release of a reportable quantity of oil or a hazardous substance in storm water in the last three years. The Gobernador Compressor Station has not had a release of a reportable quantity to date.

C. General Maintenance

A log documenting spill collection/prevention is maintained as part of a daily log of the station operator's activities and maintenance work. The log specifically addresses compressor maintenance, however the operator does inspect the general facility and the station's systems for spill collection /prevention on a routine basis. Maintenance findings are noted in a logbook and corrective action is documented.

X. SPILL/LEAK PREVENTION & REPORTING

A. Spill/Leak Potential

Potential sources of spills or leaks at this facility include the following:

1. Tank overflow or rupture;
2. Overflow or cracking of concrete sumps;
3. Rupture of process pipelines.
4. Pigging operations

Prevention of accidental releases from these sources is a high priority of Burlington Resources, Inc. (BR). Spill prevention is achieved primarily through proper execution of operating procedures and secondly, by an active equipment inspection and maintenance program. Spill detection is accomplished by routine visual inspection of facility equipment and continuous monitoring of process instrumentation.

To reduce the risk of spilled process fluids from contacting the ground surface, BR has constructed curbed concrete or containment around process equipment with a higher probability of a spill/leak. Process and maintenance areas are paved and curbed or have spill collection controls implemented if a reoccurring long term pattern of significant spills or leaks is identified that can not be remediated by general clean up procedures. Incidental leaks or process/maintenance spills that are adequately remediated are not considered significant.

B. Spill/Leak Control

General spill cleanup procedures may involve minor earthwork to prevent migration, and recovery of as much free liquid as possible. Recovered fluids would then be transported off-site for recycling or disposal. Clean up procedures by BR will follow OCD Guidelines for Remediation of Leaks, Spills and Releases.

C. Spill/Leak Reporting

Should a release of materials occur, BR will comply in accordance with provisions described in NMOCD Rule and Regulation #116 and WQCC Section 1-203.

XI. SITE CHARACTERISTICS

Much of the information used for this section was obtained from New Mexico Bureau of Mines and Mineral Resources publications and a geotechnical report written for BR by Western Technologies Inc. in December of 1989. The report was generated to document physical characteristics of soils in the area of Gobernador for the purposes of construction. Documentation of the soils involved drilling two boreholes to 25' in depth,

classifying and logging each soil type as it was encountered. The geotechnical survey is not included with this discharge plan.

A. Hydrologic Features

1. Gobernador Wash runs along the southwest edge of the site. There are several named and unnamed surface waters within a one mile area of the station including (Gobernador wash, NAPA irrigation canal, and stock ponds). The site generally slopes to the southwest.
2. Cathodic well data in the area indicates the depth to ground water to be approximately 80 feet. No ground water was encountered during test borings for the geotechnical survey.
3. Ground water flow direction is likely to be south southwest, based on a review of topographic features at the site. This would be consistent with an existing wash/arroyo which runs along the southwest edge of the site.

B. Geologic Description of Site

- 1 The soil consist of clayey and silty sand with a low to moderate load bearing capabilities. The underlying materials consist of sandstone of moderate to high load bearing capabilities.
2. The aquifer most likely to be affected by a discharge in this area is the San Jose Formation. Total Dissolved Solids (TDS) of water from this formation is estimated to be greater than 1700 mg/l on an avg.(New Mexico Bureau of Mines and Mineral Resources, 1983).
3. This formation is characterized by interbedded sandstone and mudstones. The thickness of the formation ranges up to nearly 2,700 feet, in the basin between Cuba and Gobernador. (New Mexico Bureau of Mines and Mineral Resources, 1983).
4. Depth to the top of bedrock strata was not encountered during test borings (Western Technologies Inc. Geotechnical Report)

C. Flood Protection

Gobernador lies approximately 5.5 miles to the east of the San Juan River. This area is not typically subject to flooding therefore special flood protection measures are not needed.

XII. ADDITIONAL INFORMATION

As stated previously, this facility does not intentionally discharge or dispose of any waste on-site. Containment devices are installed and regularly inspected to insure proper operation. As a result, BR has demonstrated that approval of this plan will not result in concentrations in excess of the standards of Section 3-103 or the presence of any toxic pollutant at any place of withdrawal of water for present or reasonably foreseeable future use.

XIII. AFFIRMATION

"I hereby certify that I am familiar with the information contained in and submitted with this discharge plan, and that such information is true, accurate, and complete to the best of my knowledge and belief."

Subject: Discharge Plan Renewal Notice for the following Burlington Facilities:

- GW-183 expires 2/21/2000 ARCH ROCK
GW-194 expires 6/9/2000 FRANCES
GW-193 expires 6/9/2000 SANDSTONE
GW-058 expires 10/11/2000 HART CANYON
GW-059 expires 10/11/2000 MANZANARES
GW-056 expires 11/11/2000 GOBERNADOR

WQCC 3106.F. If the holder of an approved discharge plan submits an application for discharge plan renewal at least 120 days before the discharge plan expires, and the discharger is not in violation of the approved discharge plan on the date of its expiration, then the existing approved discharge plan for the same activity shall not expire until the application for renewal has been approved or disapproved. A discharge plan continued under this provision remains fully effective and enforceable. An application for discharge plan renewal must include and adequately address all of the information necessary for evaluation of a new discharge plan. Previously submitted materials may be included by reference provided they are current, readily available to the secretary and sufficiently identified to be retrieved. [12-1-95]

Discussion:

Discussed WQCC 3106F and gave Burlington Notice to submit Discharge Plan renewal application with \$50.00 filing fee for the above listed facilities.

Re: Compressor Station Sump Integrity Inspections

Dear Mr. Price:

The purpose of this correspondence is to provide your office with written notice that the following compressor stations are to be visually tested during a three-day time frame starting May 25th, 1999:

May 25 th	May 26 th	May 27 th
Pump Canyon	Hart	Manzanares
Buena Vista	Arch Rock	Gobernador
Sandstone	Rattlesnake	Frances Mesa
Quinn	Cedar Hill	Sims Mesa
Pump Mesa		
Middle Mesa		

As required under OCD Discharge Plan Special Condition # 8:

"All pre-existing sumps and below-grade tanks must demonstrate integrity on an annual basis. Integrity tests include pressure testing to 3 pounds per square inch above normal operating pressure and/or visual inspection of cleaned out tanks and/or sumps, or other OCD approved methods".

As a result, to comply with this condition the above dates have been scheduled for cleaning out the sumps and visually inspecting each unit. Before the inspection commences, the sumps will be completely emptied and the lids removed to allow access to each unit. To complete the tests within a three-day time frame, the facilities have been logistically organized by area and the test will start each day at 7:30 a.m. at the first facility.

By providing written notice to OCD regarding these tests, it is Burlington Resources intentions to comply with the "72 hours prior to all testing" notification requirement contained in Condition #8. I thank you for your time and consideration and should you have any questions regarding this correspondence please feel free to contact me at 505-326-9537.

Sincerely,

Re: Compressor Station Sump Integrity Inspections

Dear Mr. Price:

The purpose of this correspondence is to provide your office with the results of the compressor stations visual test that was conducted at the following locations:

Pump Canyon	Hart	Manzanares
Buena Vista	Arch Rock	Gobernador
Sandstone	Rattlesnake	Frances Mesa
Quinn	Cedar Hill	Sims Mesa
Pump Mesa	Middle Mesa	

The purpose of the test was to comply not only with the terms and conditions of the original OCD Discharge Plans, but also to satisfy special condition 8. To complete the visual inspection of the sumps, Scat Hot Wash was employed to pressure wash the interior. After the unit was steam cleaned, the residual liquid was removed to allow all areas of the sump to be examined. During the sump inspection no pitting of the steel was observed and the welds appeared to be adequate for sustaining structural integrity.

I thank you for your time and consideration and should you have any questions regarding this correspondence please feel free to contact me at 505-326-9537.

Sincerely,

Jeffery T. Schoenbacher

Re: **Name Change Notification**

Dear Mr. LeMay:

This letter is provided to inform you that Meridian Oil Inc. recently had a business name change to Burlington Resources Oil and Gas Company effective July 11, 1996. Please note that UIC permits and discharge plans have not been transferred and no change of ownership has occurred. All UIC permits and discharge plans issued to and currently under review for Meridian Oil Inc. will now be associated with the Burlington Resources Oil and Gas Company name. Attached is a list of UIC permits and discharge plans issued to Meridian Oil Inc. and applications under review.

If you have any questions regarding this notice, please feel free to contact me at (505) 326-9841.

Sincerely,

Keith M. Boedecker
Sr. Staff Environmental Representative

**Re: Gobernador Compressor Station Groundwater Discharge Plan (GW - 056)
Pump Canyon Compressor Station Groundwater Discharge Plan (GW - 057)**

REC by DWB
on 8-14-96

Dear Mr. Eustice:

This letter is in response to your June 17, 1996 and June 19, 1996 requests that Meridian Oil Inc. (Meridian) provide a work plan addressing lube oil leaking from vent stacks causing soil contamination at the above referenced facilities.

The source of the lube oil is believed to be small diameter weep holes drilled into the bottom of the compressor engine starting vents. These weep holes were intended to allow rain water that may enter the stacks to seep out rather than corrode the inside of the vent. Consequently, any fluids in the line (including lube oil) seeped out of the holes and onto the ground surface.

Source Elimination:

To eliminate the source of contamination, a simple manifold system was installed and attached to each weep hole at the bottom of the starting vents. The manifold system collects any fluids in the vent stacks and directs them to the onsite underground sump; rather than allowing the fluids to fall onto the ground surface. Figure 1, attached, illustrates the solution implemented at both facilities.

Work Plan:

Working space around the area of contamination at both facilities is minimal due to high pressure gas piping and electrical conduit. Excavation of the contaminated soil will be very difficult. Instead, Meridian is proposing an in situ alternative to remediate the hydrocarbon contaminated soil.

The depth of visible contamination was determined to be 6 to 8 inches. Depth was estimated by using a hand auger and boring into the soil. Soils around the compressor building are typically compacted to 95% (no voids in the soil would be 100%). This explains the shallow penetration of lube oil from the vent stack weep holes. Instead of traveling vertically through the soil column, the lube oil traveled horizontally as seen during the inspections.

Meridian proposes using a different method at each facility to evaluate the use of the product for future releases. At the Gobernador Compressor Station, Meridian proposes using a product called OXY-1, developed by Tierra Environmental in Farmington, NM. The OXY-1 product is a dilute solution of Potassium Permanganate designed to oxidize the hydrocarbons in the soil. The product is applied to the soil surface and worked in by means of a shovel. Then the product is reapplied as analytical results require. An MSDS of the product has been attached for your review.

Meridian proposes using a product called SuperAll #38, developed by SPI in Texas to remediate the contaminated soil at Pump Canyon Compressor Station. SuperAll #38 is a degreaser and oil dispersant designed to break the physical bond that hydrocarbons have with the soil. This action normally promotes enhanced degradation of the hydrocarbons in the soil. The product will be applied to the surface of the contamination and worked in using a shovel and rake. An MSDS of the product has been attached for your review.

Representative soil samples will be taken at both facilities to be analyzed for hydrocarbons using laboratory method 418.1. Samples will be collected prior to, and at regular intervals after the work to demonstrate the effectiveness of the product.

At the end of the project, Meridian will submit a report to the NMOCD describing the methodology and the results of each product. Please contact Craig Bock at (505) 326-9537 if you have questions.

Sincerely,

Craig A. Bock
Environmental Representative

RE: Discharge Plan Inspection GW-056
Gobernador Compressor Station
San Juan County, New Mexico

Dear Mr. Boedecker:

On April 17, 1996 the New Mexico Oil Conservation Division inspected the above referenced facility for compliance with discharge plan conditions of approval as issued November 8, 1995. Based upon that inspection, please provide the New Mexico Oil Conservation Division Santa Fe Office with the following:

1. The referenced facility has experienced repeated problems with engine restart resulting in liquid hydrocarbons being blow out the top of the compressor stacks, coming out of the compressor buildings, resulting in contamination of the soils surrounding the building. Provide a plan to prevent the liquid hydrocarbons from being discharged out the top of the stacks onto the ground surface.
2. Provide a work plan addressing the clean up of the associated contaminated soils.

Please provide the above requested information by July 19, 1996.

If you have any questions contact me at (505) 827-7153.

Sincerely,

Chris Eustice
Geologist

No. 35305

STATE OF NEW MEXICO
County of San Juan:

ROBERT LOVETT being duly sworn says: That he is the Classified Manager of THE DAILY TIMES, a daily newspaper of general circulation published in English at Farmington, said county and state, and that the hereto attached Legal Notice was published in a regular and entire issue of the said DAILY TIMES, a daily newspaper duly qualified for the purpose within the meaning of Chapter 167 of the 1937 Session Laws of the State of New Mexico for publication on the following day(s):

Tuesday, September 19, 1995.

and the cost of publication was: \$111.87

On 9/19/95 ROBERT LOVETT
appeared before me, whom I know
personally to be the person who signed the
above document.

My Commission Expires March 21, 1998

Notice is hereby given that pursuant to the New Mexico Water Quality Control Commission Regulations, the following discharge plan applications have been submitted to the Director of the Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, Telephone (505) 827-7131:

(GW-56) Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted an application for renewal of their previously approved discharge plan for the Gobernador Compressor Station located in the NW/4 NW/4 of Section 30, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico. Approximately 40 gallons per day of waste water is stored in above ground, closed-top steel tanks prior to transport to an OCD approved Class II injection well for disposal. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 262 feet with a total dissolved solids concentration ranging from 1650 mg/l to 2250 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-57) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted an application for renewal of their previously approved discharge plan for the Pump Canyon Compressor Station located in the SE/4 of Section 24, Township 30 North, Range 9 West, NMPM, San Juan County, New Mexico. Approximately 85 gallons per day of waste water is stored in above ground, closed-top steel tanks prior to transport to an OCD approved Class II injection well for disposal. Ground water most likely to be affected in the event of an accidental discharge is a depth of approximately 40 feet with a total dissolved solids concentration of 1700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-224) - WesTex 66 Pipeline Company, Scott Maddox, Senior Environmental Engineer, 360 Adams Building, Bartleville, Oklahoma 74004, has submitted an application for a discharge plan for the Buckeye Crude Station located in the SE/4SW/4 of Section 34, Township 17 South, Range 35 East, NMPM, Lea County, New Mexico. Approximately 20,000 barrels of crude oil is stored in two above ground, closed-top steel tanks prior to transport to a refinery. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 234 feet with a total dissolved solids concentration of 700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-058) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, 3535 E. 30th, Farmington, New Mexico 87401, has submitted a discharge application for their Hart Canyon Compressor Station located in the SE/4 of Section 20, Township 31 North, Range 10 West, NMPM, San Juan County, New Mexico. Approximately 18 gallons per day of waste water is stored in an above ground steel tank prior to transport to an OCD approved disposal facility. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 130 feet with a total dissolved solids concentration of approximately 1,700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-059) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, 3535 E. 30th, Farmington, New Mexico 87401, has submitted a discharge application for their Manzanares Compressor Station located in Sections 3 and 4, Township 29 North, Range 8 West, NMPM, San Juan County, New Mexico. Approximately 25 gallons per day of waste water is stored in an above ground steel tank prior to transport to an OCD approved disposal facility. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 211 feet with a total dissolved solids concentration of approximately 1,700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge plan applications may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday thru Friday. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and public hearing may be requested by any interested person. Request for public hearing shall set forth the reasons why a hearing shall be held. A hearing will be held if the director determines that there is significant public interest.

If no hearing is held, the Director will approve or disapprove the plan based on the information available. If a public hearing is held, the Director will approve the plan based on the information in the plan and information presented at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 7th day of September, 1995.

OIL CONSERVATION DIVISION**

Notice is hereby given that pursuant to the New Mexico Water Quality Control Commission Regulations, the following discharge plan applications have been submitted to the Director of the Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, Telephone (505) 827-7131:

CG (GW-56) Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, P.O. 4289, Farmington, New Mexico 87499-4289, has submitted an application for renewal of their previously approved discharge plan for the Gobernador Compressor Station located in the NW/4 of Section 30, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico. Approximately 40 gallons per day of waste water is stored in above ground, closed-top steel tanks prior to transport to an OCD approved Class II injection well for disposal. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 262 feet with a total dissolved solids concentration ranging from 1650 mg/l to 2250 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

CG (GW-57) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, P.O. 4289, Farmington, New Mexico 87499-4289, has submitted an application for renewal of their previously approved discharge plan for the Pump Canyon Compressor Station located in the SE/4 of Section 24, Township 30 North, Range 9 West, NMPM, San Juan County, New Mexico. Approximately 85 gallons per day of waste water is stored in above ground, closed-top steel tanks prior to transport to an OCD approved Class II injection well for disposal. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 40 feet with a total dissolved solids concentration of 1700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

CG (GW-224) - WesTex 66 Pipeline Company, Scott Maddox, Senior Environmental Engineer, Adams Building, Bartlesville, Oklahoma 74004, has submitted an application for a discharge plan for the Buckeye Crude Station located in the SE/4SW/4 of Section 34, Township 17 South, Range East, NMPM, Lea County, New Mexico. Approximately 20,000 barrels of crude oil is stored in above ground, closed-top steel tanks prior to transport to a refinery. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 234 feet with a total dissolved solids concentration of 700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

MA (GW-058) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, 3535 30th, Farmington, New Mexico 87401, has submitted a discharge application for their Hart Canyon Compressor Station located in the SE/4 of Section 20, Township 31 North, Range 10 West, NMPM, San Juan County, New Mexico. Approximately 18 gallons per day of waste water is stored in an above ground steel tank prior to transport to an OCD approved disposal facility. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 130 feet with a total dissolved solids concentration of approximately 1,700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

MA (GW-059) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, 3535 30th, Farmington, New Mexico 87401, has submitted a discharge application for their Manzanar Compressor Station located in Sections 3 and 4, Township 29 North, Range 8 West, NMPM, San Juan County, New Mexico. Approximately 25 gallons per day of waste water is stored in an above ground steel tank prior to transport to an OCD approved disposal facility. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 211 feet with a total dissolved solids concentration of approximately 1,700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge plan applications may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday thru Friday. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and public hearing may be requested by any interested person. Request for public hearing shall set forth the reasons why a hearing shall be held.

NOTICE OF PUBLICATION

STATE OF NEW MEXICO ENERGY, MINERALS AND NATURAL RESOURCES DEPARTMENT OIL CONSERVATION DIVISION

Notice is hereby given that pursuant to the New Mexico Water Quality Control Commission Regulations, the following discharge plan applications have been submitted to the Director of the Oil Conservation Division, 2040 S. Pacheco, Santa Fe, New Mexico 87505, Telephone (505) 827-7131:

(GW-56) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted an application for renewal of their previously approved discharge plan for the Gobernador Compressor Station located in the NW/4 NW/4 of Section 30, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico. Approximately 40 gallons per day of waste water is stored in above ground, closed-top steel tanks prior to transport to an OCD approved Class II injection well for disposal. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 262 feet with a total dissolved solids concentration ranging from 1650 mg/l to 2250 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-57) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, P.O. Box 4289, Farmington, New Mexico 87499-4289, has submitted an application for renewal of their previously approved discharge plan for the Pump Canyon Compressor Station located in the SE/4 of Section 24, Township 30 North, Range 9 West, NMPM, San Juan County, New Mexico. Approximately 85 gallons per day of waste water is stored in above ground, closed-top steel tanks prior to transport to an OCD approved Class II injection well for disposal. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 40 feet with a total dissolved solids concentration of 1700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-224) - WesTex 66 Pipeline Company, Scott Maddox, Senior Environmental Engineer, 360 Adams Building, Bartlesville, Oklahoma 74004, has submitted an application for a discharge plan for the Buckeye Crude Station located in the SE/4 SW/4 of Section 34, Township 17 South, Range 35 East, NMPM, Lea County, New Mexico. Approximately 20,000 barrels of crude oil is stored in two above ground, closed-top steel tanks prior to transport to a refinery. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 234 feet with a total dissolved solids concentration of 700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-058) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, 3535 E. 30th, Farmington, New Mexico 87401, has submitted a discharge application for their Hart Canyon Compressor Station located in the SE/4 of Section 20, Township 31 North, Range 10 West, NMPM, San Juan County, New Mexico. Approximately 18 gallons per day of waste water is stored in an above ground steel tank prior to transport to an OCD approved disposal facility. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 130 feet with a total dissolved solids concentration of approximately 1,700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

(GW-059) - Meridian Oil Inc., Doug Thomas, Senior Environmental/Safety Representative, 3535 E. 30th, Farmington, New Mexico 87401, has submitted a discharge application for their Manzanares Compressor Station located in Sections 3 and 4, Township 29 North, Range 8 West, NMPM, San Juan County, New Mexico. Approximately 25 gallons per day of waste water is stored in an above ground steel tank prior to transport to an OCD approved disposal facility. Ground water most likely to be affected in the event of an accidental discharge is at a depth of approximately 211 feet with a total dissolved solids concentration of approximately 1,700 mg/l. The discharge plan addresses how spills, leaks, and other accidental discharges to the surface will be managed.

Any interested person may obtain further information from the Oil Conservation Division and may submit written comments to the Director of the Oil Conservation Division at the address given above. The discharge plan applications may be viewed at the above address between 8:00 a.m. and 4:00 p.m., Monday thru Friday. Prior to ruling on any proposed discharge plan or its modification, the Director of the Oil Conservation Division shall allow at least thirty (30) days after the date of publication of this notice during which comments may be submitted to him and public hearing may be requested by any interested person. Request for public hearing shall set forth the reasons why a hearing shall be held. A hearing will be held if the director determines that there is significant public interest.

If no hearing is held, the Director will approve or disapprove the plan based on the information available. If a public hearing is held, the Director will approve the plan based on the information in the plan and information presented at the hearing.

GIVEN under the Seal of New Mexico Oil Conservation Commission at Santa Fe, New Mexico, on this 7th day of September, 1995.

Re: Discharge Plan Renewal Amendment Fees

Dear Mr. Ashley:

Enclosed please find Groundwater Discharge Plan renewal fee checks in the amounts of \$50.00 each for the following Meridian facilities:

- Gobernador Compressor Station (GW-056)
- Pump Canyon Compressor Station (GW-057)
- Hart Canyon Compressor Station (GW-058)
- Manzanares Compressor Station (GW-059)

The Discharge Plan renewal amendments for each of the above referenced facilities were sent earlier this week for your review as per your request.

Please contact Doug Thomas at (505) 326-9561 or Craig Bock (505) 326-9537 if you have questions or if anything further is needed. Thank you for your assistance in this matter.

Sincerely,

Shanna Nava
Senior Associate

Re: Discharge Plan Renewal (GW-056) Amendments

Dear Mr. Ashley:

As per the New Mexico Oil Conservation Division's request, Meridian Oil Inc (MOI) is submitting the attached amendments to the Gobernador Compressor Station Groundwater Discharge Plan Renewal (GW-056).

Thank you for your time in reviewing this discharge plan. If I can be of further assistance, please contact me at (505) 326-9561.

Sincerely,

Doug Thomas
Senior Environmental/Safety Representative

**DISCHARGE PLAN APPLICATION FOR NATURAL GAS PROCESSING PLANTS,
 OIL REFINERIES AND GAS COMPRESSOR STATIONS**

(Refer to OCD Guidelines for assistance in completing the application.)

- I. TYPE: Compressor Station (Gobernador GW-056)
- II. OPERATOR: Meridian Oil Inc.
 ADDRESS: 3535 E 30th Farming Ln, NM 87401
 CONTACT PERSON: Doug Thomas PHONE: 326-9561
- III. LOCATION: 1/4 Nw 1/4 Section 30 Township 30N Range 7W
 Submit large scale topographic map showing exact location.
- IV. Attach the name and address of the landowner(s) of the disposal facility site.
- V. Attach description of the facility with a diagram indicating location of fences, pits, dikes, and tanks on the facility.
- VI. Attach a description of sources, quantities and quality of effluent and waste solids.
- VII. Attach a description of current liquid and solid waste transfer and storage procedures.
- VIII. Attach a description of current liquid and solid waste disposal procedures.
- IX. Attach a routine inspection and maintenance plan to ensure permit compliance.
- X. Attach a contingency plan for reporting and clean-up of spills or releases.
- XI. Attach geological/hydrological evidence demonstrating that disposal of oil field wastes will not adversely impact fresh water. Depth to and quality of ground water must be included.
- XII. Attach such other information as is necessary to demonstrate compliance with any other OCD rules, regulations and/or orders.

XIII. **CERTIFICATION**

I hereby certify that the information submitted with this application is true and correct to the best of my knowledge and belief.

Name: Doug Thomas Title: Sr. Enviro/SAFETY REP.

Signature: Doug Thomas Date: 8/24/95

DISTRIBUTION: Original and one copy to Santa Fe with one copy to appropriate Division District Office.

**GOBERNADOR COMPRESSOR STATION
GROUND WATER DISCHARGE PLAN**

I. TYPE OF OPERATION

The Gobernador Compressor Station (Gobernador) is a gas compressor station which receives lean gas via an upstream gas gathering system. At this facility the gas is compressed to an intermediate pressure.

II. OPERATOR AND LOCAL REPRESENTATIVE

A. Operator

Name: Meridian Oil, Inc.	Address: P. O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: 505-326-9700

B. Local Representative

Name: Doug L. Thomas	Address: P. O. Box 4289
City: Farmington	State: New Mexico
Zip: 87499-4289	Phone: 505-326-9561

III. FACILITY LOCATION

Township: T 30N	Range: R7W	Section: S 31 NW 1/4	County: Rio Arriba
------------------------	-------------------	-----------------------------	---------------------------

A topographic map of the area is attached as Figure 1, Facility Area Map.

IV. LANDOWNERS

Name: BLM	Address: 1235 La Plata Hwy.
City: Farmington	State: New Mexico
Zip: 87499	Phone: (505) 599 - 8900

V. FACILITY DESCRIPTION

Gobernador is constructed on a pad of approximately 6.35 acres in size. It consists of four gas compression engines (2650 hp each), and the following tanks and sumps:

Container Type	Capacity	Product	Construction Material	Location
Tank	210 barrel	Lube Oil	Steel	Above ground
Tank	210 barrel	Used Oil	Steel	Above ground
Tank	210 barrel	Ethylene glycol (EG)	Steel	Above ground
Tank	210 barrel	Produce Water	Steel	Above ground
Tank	210 barrel	Fresh Water	Steel	Above ground
Process Sump	375 gallon	Oil, EG, Water	Steel	Below ground

The attached Figure 2 illustrates the overall facility lay-out and equipment components.

VI. SOURCES, QUANTITIES & QUALITY OF EFFLUENTS

A. Waste Stream Data

Source of Waste	Type of Waste	Volume/Month	Type/Volume of Additives	Collection System/Storage
Compressor Engines	Cooling Water	Intermittent	Ethylene Glycol (EG)	Drums
Compressor Engines	Leaks	Intermittent	EG, Oil, Water	Sump
Compressor Engines	Used Oil	1200 gallons	None	Aboveground steel tank
Compressor Engines	Oil Filters	31	None	Container/bin
Inlet Filter Separator	Inlet Filters	84 per year	None	Container/bin
Slug Catcher Inlet Separator	Produced Water	20 barrels	Corrosion Inhibitors	Aboveground steel tank
Trash	Solid Waste	1-2 Containers	None	Container/bin

B. Quality Characteristics

- Note that there are no process waste stream discharges from Gobernador to the ground surface. All waste streams are contained and their disposition is described in section VIII.
- Chemical analysis has not been performed on any of the waste streams because they are not disposed of on-site as an "effluent." Produced water from the inlet filter separator may contain the BETX hydrocarbon compounds listed in WQCC 1-101.ZZ. Similarly, used oil collected in the sump will contain the WQCC 1-101.ZZ hydrocarbon compounds.

C. Commingled Waste Streams

1. Produced water from the inlet scrubbers, filter separator, and drips and/or leaks (de minimus quantities) from compressors, compressor engines, elevated oil lube tanks may be commingled prior to being hauled for disposal. In addition, wash water (fresh water) may be introduced into the sump during maintenance operations.

VII. TRANSFER & STORAGE OF PROCESS FLUIDS & EFFLUENTS

A. Storage

Information on the waste stream collection and storage containers is summarized in the tables in sections V and VI.

B. Flow Schematics

The individual "treatment" units are shown on Figure 2. Produced water may be generated during the compression of gas with water being diverted to an aboveground tank.

C. Surface and Subsurface Discharge Potential

1. The table in section V provides a listing of all aboveground tanks and below grade sumps. Pressurized pipelines carry the compressed gas through the station to the outlet meter run.
2. Used compressor lube oil and engine crankcase oil is pumped into the 210 barrel used oil tank. Drips and minor leaks (de minimus quantities) from the compressors, compressor engines and elevated lube oil tank may drain into the sump. Fluids collected in the sump are periodically transferred to the 210 bbl above ground storage tank for disposal (see section VIII).
3. The size and construction material of the collection units is described in the table in section V.

D. NMOCD Design Criteria

1. The 210 bbl tanks (produced water tank, used oil tank, EG tank, and lube oil tank) are located in a 101' x 39' x 4' bermed area. Capacity of the bermed areas meets the general engineering practice of one and one third times the capacity of the largest tank. Each of the five tanks are independent and are not connected together by a common manifold.
2. No drums are used or stored on location. To reduce the risk of spilled process fluids from contacting the ground surface, MOI has constructed curbed concrete or containment around process equipment with a higher probability of a spill/leak.
3. The below ground sump complies with OCD specifications. Sump is equipped with double walls and a leak detection system that provides a discrete alarm which can be viewed and monitored through the stations telemetry system 24 hours per day.
4. The installation of the 210 bbl storage tanks has been constructed on a 6" gravel pack, contained in a steel ring. Any leak in the tanks will be identified in the area outside of the steel ring.

E. Underground Pipelines

Mechanical integrity testing of the underground process pipelines is performed prior to start-up and on an "as needed" basis (modification or repairs).

F. Proposed Modifications

The existing site conditions at Gobernador provide protection from present or future ground water contamination. No additional modifications are proposed at this time.

VIII. EFFLUENT DISPOSAL

A. On-Site Disposal

The Control Room is equipped with a toilet and sink, and uses a 800 gallon septic tank with a 300 sq. ft. constructed leach field adjacent to the motor control center.

B. Off-Site Disposal

The following table provides information about off-site waste disposal:

Waste Stream	Shipment Method	Shipping Agent	Final Disposition	Receiving Facility
Produced Water	Truck	<i>See Note 1</i>	Class II Well	<i>See Note 2</i>
Inlet Separator, Used Oil, TEG and Fuel Gas Filters	Truck	<i>See Note 3</i>	Filters are landfilled	Waste Management C/R 3100 Aztec, NM <i>See Note 4 for approved profile #</i>
Engine coolant	Truck	Overland Dehy 5895 US Hwy. 64 Bloomfield, NM	Recycled	Overland Dehy 5895 US Hwy. 64 Bloomfield, NM
Used Oil	Truck	<i>See Note 1</i>	Recycled	Storage 1 Facility Meridian Oil, Inc. 3535 E. 30th Farmington, NM
Solid Waste (Trash/Refuse)	Truck	Waste Management C/R 3100 Aztec, NM	Landfill	Waste Management C/R 3100 Aztec, NM

Note 1: The trucking agent contracted to ship effluents off-site will be one of the following:

Dawn Trucking Co. 318 Hwy. 64 Farmington, New Mexico.	Chief Transport 604 W. Pinon Farmington, New Mexico	Meridian Oil Trucking 6001 Hwy. 64 Bloomfield, NM 87413	Sunco Trucking 708 S. Tucker Ave. Farmington, New Mexico
---	---	---	--

Note 2: The off-site Disposal Facility will be one of the following:

McGrath SWD #4 Sec. 34, T-30-N, R-12-W San Juan County New Mexico	112 Y SWD Sec. 26, T-30-N, R-6-W Rio Arriba County New Mexico	Basin Disposal Sec. 3, T-29-N, R-11-W 6 County Rd 5046 Bloomfield, New Mexico
--	--	--

Note 3: The shipping agent for this material will be one of the following companies:

Waste Management Road 3100 Aztec, New Mexico	Cooper/Cameron Incorp. 3900 Bloomfield Hwy. Farmington, New Mexico	Overland Dehy 5895 US Hwy. 64 Bloomfield, New Mexico
--	--	--

Note 4: Operator approval for disposal of the shipped wastes to landfill:

Waste Management C/R 3100 Aztec, NM	Profile # 025149, 025150, 0215149, 266263
--	--

C. Proposed Modifications

The existing site conditions at Gobernador provide protection from present or future ground water contamination. No additional modifications are proposed at this time.

IX. INSPECTION, MAINTENANCE AND REPORTING

A. Leak Detection/Site Visits

The below ground sump is equipped with double walls and a leak detection system that provides a discrete alarm which can be viewed through the stations telemetry system.

Daily log sheets are filled out along with routine visual inspection of facility equipment and continuous monitoring of process instrumentation are performed to identify possible leaks.

Should a release of materials occur, MOI will comply in accordance with provisions described in NMOCD Rule and Regulation #116 and WQCC section 1-203.

B. Precipitation/Runoff Control

Storm water run-off does not come in contact with process waste streams. Any precipitation that contacts the process equipment is contained within bermed or containment areas and allowed to evaporate. The facility pad is maintained to prevent surface accumulations.

X. SPILL/LEAK PREVENTION & REPORTING

A. Spill/Leak Potential

Potential sources of spills or leaks at this facility include the following:

1. tank overflow or rupture;
2. overflow or cracking of concrete sumps;
3. rupture of process pipelines.
4. pigging operations

Prevention of accidental releases from these sources is a high priority of Meridian Oil Inc. (MOI). Spill prevention is achieved primarily through proper execution of operating procedures and secondly, by an active equipment inspection and maintenance program. Spill detection is accomplished by routine visual inspection of facility equipment and continuous monitoring of process instrumentation.

To reduce the risk of spilled process fluids from contacting the ground surface, MOI has constructed curbed concrete or containment around process equipment with a higher probability of a spill/leak.

B. Spill/Leak Control

General spill cleanup procedures may involve minor earthwork to prevent migration, and recovery of as much free liquid as possible. Recovered fluids would then be transported off-site for recycling or disposal. Clean up procedures by MOI will follow OCD Guidelines For Remediation of Leaks, Spills and Releases dated August 13, 1993.

C. Spill/Leak Reporting

Should a release of materials occur, MOI will comply in accordance with provisions described in NMOCD Rule and Regulation #116 and WQCC section 1-203.

XI. SITE CHARACTERISTICS

Much of the information used for this section was obtained from New Mexico Bureau of Mines and Mineral Resources publications and a geotechnical report written for MOI by Western Technologies Inc. in December of 1989. The report was generated to document physical characteristics of soils in the area of Gobernador for the purposes of construction. Documentation of the soils involved drilling two boreholes to 25' in depth, classifying and logging each soil type as it was encountered. The geotechnical survey is not included with this discharge plan.

A. Hydrologic Features

1. Gobernador Wash runs along the southwest edge of the site. There are several named and unnamed surface waters within a one mile area of the station including (Gobernador wash, NAPA irrigation canal, and stock ponds). The site generally slopes to the southwest.
2. Cathodic well data in the area indicates the depth to ground water to be approximately 80 feet. No ground water was encountered during test borings for the geotechnical survey.
3. Ground water flow direction is likely to be south southwest, based on a review of topographic features at the site. This would be consistent with an existing wash/arroyo which runs along the southwest edge of the site.

B. Geologic Description of Site

- 1 The soil consist of clayey and silty sand with a low to moderate load bearing capabilities. The unerlying materials consist of sandstone of moderate to high load bearing capabilities.
2. The aquifer most likely to be affected by a discharge in this area is the San Jose Formation. Total Dissolved Solids (TDS) of water from this formation is estimated to be greater than 1700 mg/l on an avg. (New Mexico Bureau of Mines and Mineral Resources, 1983).
3. This formation is characterized by interbedded sandstone and mudstones. The thickness of the formation ranges up to nearly 2,700 feet, in the basin between Cuba and Gobernador. (New Mexico Bureau of Mines and Mineral Resources, 1983).
4. Depth to the top of bedrock strata was not encountered during test borings (Western Technologies Inc. Geotechnical Report)

C. Flood Protection

Gobernador lies approximately 5.5 miles to the east of the San Juan River. This area is not typically subject to flooding therefore special flood protection measures are not needed.

XII. ADDITIONAL INFORMATION

As stated previously, this facility does not intentionally discharge or dispose of any waste on-site. Containment devices are installed and regularly inspected to insure proper operation. As a result, MOI has demonstrated that approval of this plan will not result in concentrations in excess of the standards of Section 3-103 or the presence of any toxic pollutant at any place of withdrawal of water for present or reasonably foreseeable future use.

XIII. AFFIRMATION

"I hereby certify that I am familiar with the information contained in and submitted with this discharge plan, and that such information is true, accurate, and complete to the best of my knowledge and belief."

CERTIFIED MAIL
RETURN RECEIPT NO. Z-765-962-757

Mr. Randy Limbacher
 Regional Vice President
 Meridian Oil, Inc.
 P.O. Box 4289
 Farmington, New Mexico 87499-4289

RE: Discharge Plan Renewals
San Juan County, New Mexico

Dear Mr. Limbacher:

On October 11, 1990, the following groundwater discharge plans were approved by the Director of the New Mexico Oil Conservation Division (OCD). The discharge plans were required and submitted pursuant to Water Quality Control Commission (WQCC) regulations and were approved for a period of five years. The approvals will expire on October 11, 1995.

- GW-056, Gobernador Compressor Station located in the NW/4, Section 30, Township 30 North, Range 7 West, NMPM, San Juan County, New Mexico.
- GW-057, Pump Canyon Compressor Station located in Section 24, Township 30 North, Range 9 West, NMPM, San Juan County, New Mexico.
- GW-058, Hart Canyon Compressor Station located in the SE/4, Section 20, Township 31 North, Range 10 West, NMPM, San Juan County, New Mexico.
- GW-059, Manzanares Compressor Station located in Sections 3 and 4, Township 29 North, Range 8 West, NMPM, San Juan County, New Mexico.

Mr. Randy Limbacher
August 22, 1995
Page 2

On March 21, 1995 you were notified of the upcoming expirations. In order to continue operations at the facilities, the discharge plans must be renewed prior to expiration.

If your facilities continue to have potential or actual effluent or leachate discharges and you wish to continue operations, you must renew your discharge plans. The OCD is reviewing discharge plan submittals and renewals carefully and the review time can extend for several months. Please indicate whether you have made, or intend to make, any changes in your systems, and if so, please include these modifications in your applications for renewal.

Please submit the originals and one copy to the OCD Santa Fe Office and one copy to the OCD Aztec District Office. Note that the completed and signed application forms must be submitted with your discharge plan renewal requests.

Each discharge plan renewal application is subject to the WQCC Regulations 3-114 discharge plan fees. Every billable facility submitting a discharge plan renewal will be assessed a fee equal to the filing fee of fifty (50) dollars plus one-half of the flat fee for compressor stations based on the combined horsepower at the facility.

The (50) dollar filing fee is to be submitted with each discharge plan renewal application and is nonrefundable. The flat fee for each approved discharge plan renewal may be paid in a single payment due at the time of approval, or in equal annual installments over the duration of the discharge plan.

Please make all checks payable to: **NMED-Water Quality Management** and addressed to the OCD Santa Fe Office.

If you no longer have any actual or potential discharges a discharge plan is not need, please notify this office. If you have any questions regarding this matter, please do not hesitate to contact Mark Ashley at (505) 827-7155 or Chris Eustice at (505) 827-7153.

Sincerely,

Roger C. Anderson
Environmental Bureau Chief

**RE: Discharge Plan GW-056 Renewal
Gobernador Compressor Station
San Juan County, New Mexico**

Dear Mr. Owen:

On October 11, 1990, the groundwater discharge plan, GW-056, for the Gobernador Compressor Station located in the NW/4, Section 30, Township 30 North, Range 7 West, NMPM, San Juan County, New Mexico, was approved by the Director of the New Mexico Oil Conservation Division (OCD). This discharge plan was required and submitted pursuant to Water Quality Control Commission (WQCC) regulations and was approved for a period of five years. The approval will expire on October 11, 1995.

If your facility continues to have potential or actual effluent or leachate discharges and you wish to continue operation, you must renew your discharge plan. The OCD is reviewing discharge plan submittals and renewals carefully and the review time can extend for several months. Please indicate whether you have made, or intend to make, any changes in your system, and if so, please include these modifications in your application for renewal.

To assist you in preparation of your application, I have enclosed an application form and a copy of the OCD's Guidelines for the Preparation of Ground Water Discharge Plans at Natural Gas Plants and a copy of the WQCC regulations. Please submit the original and one copy to the OCD Santa Fe Office and one copy to the OCD Aztec District Office. Note that the completed and signed application form must be submitted with your discharge plan renewal request.

Mr. C.R. Owen
March 21, 1995

Dear Mr. Lemay:

This responds to your public notice dated August 31, 1990, in which several proposed groundwater discharge plans were described. We have reviewed all of the plans and recommend that any open pits or tanks on the individual sites be covered or screened to prevent accessibility by waterfowl.

Our comments refer to the following permits:

(GW-56) - Meridian Oil Gathering Inc., Gobernador Compressor Station located in the NW 1/4, Section 31, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico.

(GW-57) - Meridian Oil Gathering Inc., Pump Canyon Compressor Station located in Section 24, Township 30 North, Range 9 West, NMPM, San Juan County, New Mexico.

(GW-58) - Meridian Oil Gathering Inc., Hart Canyon Compressor Station located in the SE 1/4, Section 20, Township 31 North, Range 10 West, NMPM, San Juan County, New Mexico.

(GW-59) - Meridian Oil Gathering Inc., Manzanares Compressor Station located in Section 3 and 4, Township 10 North, Range 8 West, NMPM, San Juan County, New Mexico.

If you have any questions concerning our comments, please contact Thomas O'Brien or Scott P. Hamilton-McLean at (505) 883-7877.

Sincerely,

Michael J. Donahoo
Acting Field Supervisor

RE: Discharge Plans GW-56, GW-57, GW-58, GW-59

Dear Mr. Anderson:

The following information is being provided in response to your request concerning the Discharge Plans for the Gobernador, Hart Canyon, Manzanares, and Pump Canyon Compressor Stations.

1. The wash down water is trucked off location for off-site disposal along with the used lube oil. These two effluents are not separated at the compressor station facility. Mesa Oil, Inc., 4701 Broadway Blvd. SE, Albuquerque, NM provides final disposition of the wash down water, along with the used lube oil.
2. Water for these facilities is purchased from the City of Farmington and is trucked into location.
3. 7.5 Quadrangle maps are enclosed showing the location of each compressor station. These maps indicate the proximity of these stations to bodies of water and water courses within a one mile perimeter of each station.

Also requested was the Ground Water Depth and Total Dissolved Solids (TDS) at the location of each compressor station. This information is based on well log and well permit information from the New Mexico State Engineers Office. From this information, the calculated TDS concentrations and approximate depths to groundwater for the compressor stations are as follows:

<u>STATION</u>	<u>DEPTH TO WATER (ft.)</u>	<u>TDS (mg/l)</u>
<u>Gobernador</u>	262	1644-2442
Hart Canyon	204	429-585
Pump Canyon	82	3157-4305
Manzanares	473	1188-1620

If any additional information is required, please contact Larry Dillon at (505)326-9714.

Sincerely,

C.R. Owen
Operations Manager

OIL CONSERVATION DIVISION**

Notice is hereby given that pursuant to New Mexico
Water Quality Control Commission Regulations, the
following discharge plan renewal application has been
submitted to the Director of the Oil Conservation
Division, State Land Office Building, P. O. Box 2088,
Santa Fe, New Mexico 87504-2088, Telephone (505)
827-5806:

(GW-56) - Meridian Oil Gathering, Inc., C. R.
Owen, Regional Operations Manger, P. O. Box
4289, Farmington, New Mexico, 87499-4289,
has submitted a discharge application for its
Gobernador Compressor Station located in the
NW/4 NW/4, Section 31, Township 30 North,
Range 7 West, NMPM, Rio Arriba County, New
Mexico. Approximately 225 gallons per day of
wastewater is disposed of at an OCD approved
offsite disposal facility. Ground water most
likely to be affected by any discharge to the
surface is at a depth of approximately 262 feet
with a total dissolved solids concentration from
1650 to 2250 mg/l. The discharge plan ad-
dresses how spills, leaks and other discharges
to the ground will be managed.

(GW-57) - Meridian Oil Gathering, Inc., C. R.
Owen, Regional Operations Manager, P. O.
Box 4289, Farmington, New Mexico,
87499-4289, has submitted a discharge ap-
plication for its Pump Canyon Compressor Sta-
tion located in Section 24, Township 30 North,
Range 9 West, NMPM, San Juan County, New
Mexico. Approximately 225 gallons per day of
wastewater is disposed of at an OCD approved
offsite disposal facility. Ground water most
likely to be affected by any discharge to the
surface is at a depth of approximately 82 feet
with a total dissolved solids concentration from
3157 to 4300 mg/l. The discharge plan ad-
dresses how spills, leaks and other discharges
to the ground will be managed.

(GW-58) - Meridian Oil Gathering, Inc., C. R.
Owen, Regional Operations Manager, P. O.
Box 4289, Farmington, New Mexico,
87499-4289, has submitted a discharge ap-
plication for its Hart Canyon Compressor Sta-
tion located in the SE/4, Section 20, Township
31 North, Range 10 West, NMPM, San Juan
County, New Mexico. Approximately 225 gal-
lons per day of wastewater is disposed of at an
OCD approved offsite disposal facility. Ground
water most likely to be affected by any dis-
charge to the surface is at a depth of approx-
imately 204 feet with a total dissolved solids
concentration from 429 to 585 mg/l. The dis-
charge plan addresses how spills, leaks and
other discharges to the ground will be man-
aged.

(GW-59) - Meridian Oil Gathering, Inc., C. R.
Owen, Regional Operations Manager, P. O.
Box 4289, Farmington, New Mexico,
87499-4289, has submitted a discharge ap-
plication for its Manzanares Compressor Sta-
tion located in Sections 3 and 4, Township 10
North, Range 8 West, NMPM, San Juan County,
New Mexico. Approximately 225 gallons per
day of wastewater is disposed of at an OCD
approved offsite disposal facility. Ground water
most likely to be affected by any discharge to
the surface is at a depth of approximately 473
feet with a total dissolved solids concentration
from 1188 to 1620 mg/l. The discharge plan
addresses how spills, leaks and other dis-
charges to the ground will be managed.

Any interested person may obtain further infor-
mation from the Oil Conservation Division and may
submit written comments to the Director of the Oil
Conservation Division at the address given above.
Prior to ruling on any proposed discharge plan or its
modification, the Director of the Oil Conservation
Division shall allow at least thirty (30) days after the
date of publication of this notice during which com-
ments may be submitted to him and public hearing

may be requested by any interested person. Requests for public hearing shall set forth the reasons why a hearing should be held. A hearing will be held if the Director determines there is significant public interest.

If no public hearing is held, the Director will approve or disapprove the proposed plan based on information available. If a public hearing is held, the Director will approve or disapprove the proposed plan based on information in the plan and information submitted at the hearing.

Dear Mr. Anderson:

The State Engineers Office has provided us with ground water information obtained from wells located in the vicinity of Meridian Oil Company's Gobernador, Hart, Pump and Manzanares compressor stations.

Based on this information, the calculated Total Dissolved Solids (TDS) concentrations and approximate depths to groundwater for these compressor stations are as follows:

<u>STATION</u>	<u>DEPTH TO WATER (ft)</u>	<u>TDS (mg/l)</u>
Gobernador	262	1644-2242
Hart	204	429-585
Pump	82	3157-4305
Manzanares	473	1188-1620

I hope this information will satisfy your requirements. If you have any questions please call

Sincerely,

RE: Discharge Plans GW-56, GW-57, GW-58, GW-59
Gobernador, Pump Canyon, Hart Canyon, and Manzanares Compressor Stations

Dear Mr. Owen:

The Oil Conservation Division (OCD) has received and is in the process of reviewing the above referenced discharge plan applications. The plan submittals dated July 27, 1990, were received by the OCD on July 30, 1990. The following information is requested to complete the applications:

1. Section II.C.2 states washdown water is pumped from an underground sump to an above ground tank. What is the ultimate disposition of this wastewater?
2. Section IV.A. states water for the facilities is provided by wells. Submit the location of each well. If they are within one mile of the facilities, provide the drilling logs, depth to water and total dissolved solids concentration of the water.
3. Submit the location of any bodies of water, watercourses and ground water discharge sites within one mile of the outside perimeter of each facility.

Ground water characterization is needed for inclusion in a public notice. Submission of the above information will allow review of your applications to continue.

RE: Ground Water Discharge Plans -
Gobernador, Hart Canyon, Manzanares,
and Pump Canyon Compressor Stations

Dear Mr. Anderson,

Meridian Oil Gathering Inc. is submitting Discharge Plans for the four referenced compressor stations. As indicated in earlier correspondence with the Oil Conservation Division, the Gobernador and Hart Canyon Stations have been operating for the past four months. The Manzanares Station was started up in mid July and the Pump Canyon Station is currently under construction.

As requested, three copies of each Discharge Plan have been provided. If there is a need for any additional information, please contact Larry Dillon at (505) 326-9714.

C. R. Owen
Meridian Oil Inc.
P.O. Box 4289
Farmington, NM 87499-4289
(505) 326-9700

C. Plant location:
NW/4 of the NW/4 of Section 31,
T30N, R7W, N.M.P.M.
Rio Arriba County, NM (see figure 1)

D. Purpose of Plant:

Field compression facility, which will be used in the gathering of Fruitland Coal gas.

Producer: Meridian Oil, Inc.

Process: Dehydrated gas enters the station at a pressure of 300 psig. The natural gas will be compressed to 900 psig and discharged into a pipeline leaving the station.

Design Conditions:

Single Stage Compression

Gas Volume	180 MMSCFD
Oper. Press	300-900 PSIG
Speed Range	900 rpm
Station hp	10,600 hp

E. Three copies of Discharge Plan to OCD.

F. Affirmation:

"I hereby certify that I am familiar with the information contained in and submitted with this discharge plan and that such information is true, accurate, and complete to the best of my knowledge and belief."

II. PLANT PROCESS

A. Sources and Quantities of Effluent and Process Fluids

The natural gas stream entering the plant is a very lean gas, essentially all methane and CO₂. The gas is field dehydrated before entering the station.

1. Fresh water will be used to clean or wash-down the compressors, engines, and floor of the compressor buildings. The contaminants will be dirt and small amounts of lubricating oil, which may spill onto the floor of the compressor building during routine maintenance. The usage rate of wash down water is estimated at 3,500 gallons per month.
2. In routine maintenance of the compressor engines, the oil in the engines will be changed approximately every 3 months, at a rate of oil use of 330 gallons per month.
3. Free liquid from the pipeline will consist almost entirely of water that condenses out of the gas as it travels through the pipe. The estimated rate of condensed water is 3,000 gallons per month. Due to the dry nature of this gas, no liquid hydrocarbons will be present.

B. Quality Characteristics

1. Mobil Pegasus 444 is used for the lubricating oil for the compressor engines. Please refer to the enclosed Material Safety Data Sheets (MSDS) for a description of this product.

C. Transfer and Storage of Process Fluids and Effluents

1. All pressure vessels in this plant conform to ASME Code. All process piping was hydrotested, designed, and fabricated per ASME B31.3 Code. All pressure piping welds 2" and larger were 100% x-rayed. Maximum operating pressures for the pipelines are Suction, 750 psig; and Discharge, 1480 psig.
2. The floor drains in the compressor building allow the wash down water and used compressor engine oil to gravity drain into an underground sump tank. This sump tank is a new, 375-gallon, doubled-walled steel tank with leak detection. This sump tank will be continually pumped down into a new above ground internally coated steel vertical tank (capacity 8,400 gallons), with a dirt berm built around the steel tank.
3. All chemical barrels and tanks will be set over curbed concrete pad.

D. Spill/Leak Prevention and Housekeeping Procedures

1. All operations personnel have been instructed to handle process fluid spills or leaks as follows:
 - Small spills: Cover with sand to soak up fluid and shovel into drums for off-site disposal.
 - Large spills: Dike around spill and pump into drums. Call vacuum truck if necessary.
 - Any spill large enough to require a dike to contain it will be reported immediately by phone to the OCD. Written notification will follow within one week per section 1-203 of the New Mexico Water Quality Control Commission Regulation.
2. The wash down water sump tank is a doubled walled steel tank, which includes a leak detection system.

Critical areas in the high pressure gas piping will be routinely inspected by U.T. examination for corrosion. Mobile Inspection Services, Inc. has been contracted to inspect the critical areas in the liquid process piping for corrosion. Piping cut out for any reason will be visually inspected for corrosion. Corrosion coupons have been installed in the piping to detect any possibility of corrosion.

III. EFFLUENT DISPOSAL

- A.
 1. The control room is equipped with a toilet and sink, and uses a septic tank and newly constructed 300 sq. ft. leach field adjacent to the motor control center.
 2. The used lube oil from the compressor engines will be sold to a recycling contractor. This contractor will be approved by the New Mexico Environmental Improvement Division for the hauling and final disposition of the used oil.
 3. The shipping agent contracted for off-site disposal is Mesa Oil, Inc., 4701 Broadway Blvd SE, Albuquerque, New Mexico.

IV. SITE CHARACTERISTICS

- A. Water for this facility is provided by a well.
- B. Depth to ground water is estimated to be greater than 25 feet.

A soil survey was performed by Western Technologies, Inc., 400 South Lorene Avenue, Farmington, New Mexico. Soils at the site consist of clayey and silty sand with low to moderate load bearing capabilities. The underlying materials consist of sandstone of moderate to high bearing capacity. Surface soils to depths of 12 to 16 feet were found to be silty or clayey sands of loose to medium density and nil to low plasticity.

- C. Flood potential is very unlikely

Flood protection - N/A.

V. ADDITIONAL INFORMATION

Produced water will not normally be present in the pipeline, as all Fruitland Coal gas gathered into this system will be dehydrated before it enters the pipeline. If there is a failure of a dehydration unit and produced water does enter the pipeline, this water will be separated out at the station. Any such produced water will be trucked back to the field and disposed of in a well designated for produced water from the Fruitland Coal.

RE: Discharge Plan Requirement
Meridian Compressor Stations

Dear Mr. Owen:

Under the provisions of the Water Quality Control Commission (WQCC) Regulations you are hereby notified that the filing of discharge plans is required for the following compressor stations.

1. Hart Canyon Compressor Station - SE/4, Section 20, Township 31 North, Range 10 West, Rio Arriba County, New Mexico.
2. Gobernador Compressor Station - NW/4 NW/4, Section 31, Township 30 North, Range 7 West, Rio Arriba County, New Mexico.
3. Manzanares Compressor Station - Section 4, Township 29 North, Range 8 West, San Juan County, New Mexico.
4. Pump Canyon Compressor Station - Section 24, Township 30 North, Range 8 West, San Juan County, New Mexico.

This notification of discharge plan requirement is pursuant to Sections 3-104 and 3-106 of the WQCC Regulations. The discharge plan, defined in Section 1.101.P. of the WQCC Regulations, should cover all discharges of effluent or leachate at the plant site or adjacent to the plant site. Included in the application should be plans for controlling spills and accidental discharges at the facility (including detection of leaks in buried underground tanks and/or piping).

A copy of the regulations is enclosed for your convenience. Also enclosed is a copy of an OCD guide to the preparation of discharge plans for gas processing plants. The guidelines are presently being revised to include berming of tanks, curbing and paving of process areas susceptible to leaks or spills and the disposition of any solid wastes. Three copies of each discharge plan application should be submitted.

Mr. C. R. Owen
April 19, 1990
Page -2-

Section 3-106.B. of the WQCC Regulations allows the Director to authorize discharges from a facility without a discharge plan for a period not to exceed 120 days. This authorization was granted on March 27, 1990 for the Gobernador and Hart Canyon Compressor Stations and will commence on the day you receive this notification.

If the Pump Canyon and Manzanares Compressor Stations are constructed and ready for testing before discharge plan approval, a 120 day authorization to discharge without an approved discharge plan can be approved if good cause is shown.

If there are any questions on this matter, please feel free to call David Boyer at 827-5812, or Roger Anderson at 827-5884 as they have the assigned responsibility for review of all discharge plans.

Sincerely,

William J. LeMay
Director

RE: Discharge Plan Requirement
Gobernador and Hart Compressor Stations

Dear Mr. Owen:

The Oil Conservation Division (OCD) has received your request, dated March 23, 1990, for authorization to discharge without an approved discharge plan while the OCD is determining if a discharge plan will be required.

Based on the information in the request and for good cause shown your request to discharge without a discharge plan at the Gobernador Compressor Station located in the NW/4 NW/4, Section 31, Township 30 North, Range 7 West, NMPM, Rio Arriba County, New Mexico, and the Hart Canyon Compressor Station located in the SE/4, Section 20, Township 31 North, Range 10 West, N.M.P.M., San Juan County, New Mexico, is hereby approved.

This approval will allow Meridian Oil to test and operate the newly constructed stations while the OCD evaluates the need for a Discharge Plan. The approval will be for a period of 120 days commencing on the date you receive notice a Discharge Plan is required, if such a determination is made following a site inspection at both stations.

If you have any questions, please contact Roger Anderson at (505) 827-5884.

Sincerely,

A handwritten signature in black ink, appearing to read "William J. LeMay".

RE: Request for an Authorization to Discharge
Without an Approved Discharge Plan
Gobernador and Hart Canyon Compressor Stations

Dear Mr. Anderson:

Meridian Oil Gathering, Inc. requests an 'Authorization to Discharge Without an Approved Discharge Plan', while the OCD is evaluating the need for discharge plans at the Gobernador and Hart Canyon compressor stations. As Mr. Larry Dillon stated to you over the phone, both of these facilities are very near completion. The Hart Canyon compressor station is in a testing mode and will be fully operational by March 24, 1990. The Gobernador compressor station is expected to be fully operational by April 5, 1990.

In your letter of February 21, 1990 you stated the need for site visits to aid in your decision concerning discharge plans. Meridian will arrange for you to visit these facilities at your earliest convenience. Please contact Mr. Dillon at (505)326-9714 to make arrangements for your visit.

Your letter of February 21, 1990 also pointed out the following omissions in the 'Notices of Intent', which were submitted by Meridian Oil Gathering, Inc. on February 5, 1990.

1. Notices of Intent were not signed or dated.
2. Topographic maps and locations were not included.

These omissions have been corrected and the required information is attached.

If you have any questions or need further information, do not hesitate to call.

Sincerely,

C.R. Owen

C.R. Owen

3/23/90

GOVERNADOR COMPRESSOR STATION
DISPOSAL PLAN

The Gobernador station will be a field compression facility, which will be used in the gathering of Fruitland Coal gas. There will be liquid waste as a result of the operation of this station. Following is a description of these waste fluids and the disposal plan for each.

WASH-DOWN WATER:

Fresh water will be used to clean or wash-down the compressors and engines, and the floor of the compressor building. The contaminants will be dirt and small amounts of lubricating oil, which may spill onto the floor of the compressor building during routine maintenance. It is estimated that the usage rate of wash-down water will be 3,500 gallons (83 bbl) per month.

There are floor drains in the compressor building, which will allow the wash-down water to gravity drain into an underground sump tank. This sump tank is a double walled steel tank, which includes a leak detection system. This sump tank has a capacity of 375 gallons. This sump tank will be continually pumped down, with the water being pumped into an above ground vertical tank (capacity 8,400 gallons). This water will finally be trucked to an approved disposal well.

USED LUBRICATING OIL:

In the routine maintenance of the compressor engines the lubricating oil will be changed out, resulting in used lube oil. The oil in the engines will be changed approximately every three months, which is a rate of used oil of 330 gallons (8 bbl) per month.

When the engine oil is changed, the used lube oil will gravity drain from the engines into the underground sump tank. The used lube oil will be sold to a recycling contractor, who will truck the oil off location. This contractor will be approved by the New Mexico Environmental Improvement Division in the hauling and final disposition of the used oil. The used oil will finally be recycled by the contractor.

PIPELINE LIQUIDS:

As the gas stream enters the station, all free liquids are separated out before the gas enters the compressors. These liquids will be pumped into a separate above ground vertical tank. This tank will also have a capacity of 8,400 gallons.

Gobernador Compressor Station
Disposal Plan
page 2

Any free liquid from the pipeline will consist almost entirely of water that condenses out of the gas, as it travels through the pipe. The estimated rate of condensed water is 3000 gallons (71 bbl) per month. Due to the dry nature of this gas, no liquid hydrocarbons will be present. An extremely small trace of corrosion inhibitor is the only other fluid expected. This condensed water will be suitable for pumping into a disposal well, and will be trucked to such a facility.

Produced water will not normally be present in the pipeline, as all Fruitland Coal gas gathered into this system will be dehydrated before it enters the pipeline. If there is a failure of a dehydration unit and produced water does enter the pipeline; this water will be separated out at the station. Any such produced water will be trucked back to the field and disposed of in a well designated for produced water from the Fruitland Coal.

LEGAL DESCRIPTION
of
Proposed Trunk "A" Compressor Site
NW/4, Sec. 31, T30N, R7W, N.M.P.M.

That certain parcel of land situated in the NW/4 of the NW/4 of Section 31, T30N, R7W, N.M.P.M., Rio Arriba County, New Mexico. And more particularly described as follows.

BEGINNING at the NE Corner of Section 36, T30N, R8W, N.M.P.M.,
THENCE: S00-06W, 654.34 FT.
THENCE: N83-38-03E, 713.90 FT.
THENCE: N09-15-47W, 439.67 FT.
THENCE: N67-56-03W, 688.05 FT.
THENCE: S00-01-52E, 117.23 FT. to the "Point of Beginning" for this description.

Containing 9.247 Acres more or less.
Subject to Easements and restrictions of record.

Farmington, New Mexico**

RE: Notice of Intent to Discharge

Dear Mr. Owen:

The Oil Conservation Division (OCD) has received your Notice of Intent to Discharge (NOI) for your Gobernador and Hart Canyon compressor stations. The following are omissions from the notice:

- 1. Notice of Intent was not signed or dated.**
- 2. A topographic map and plot of each facility was not included.**

Based on the generalized location provided for each facility, a visit to the site by OCD personnel will be required before determining the need for a discharge plan. I will be in contact with you in the next few weeks to schedule a site visit.

If you have any questions, please do not hesitate to call me at (505) 827-5884.

Sincerely,

**Roger C. Anderson
Environmental Engineer**

RE: Notice of Intent to Discharge
Gobernador and Hart Canyon Compressor Stations

Dear Mr. Anderson:

Meridian Oil Gathering Inc. is filing a 'Notice of Intent to Discharge' for liquid waste from the Gobernador and the Hart Canyon compressor stations. Enclosed is a Notice of Intent for each station along with a Disposal Plan, which Meridian intends to implement. These compressor stations are currently under construction.

If you have any questions or need additional information, contact Larry Dillon at (505)326-9714.

Sincerely,

C. Ray Owen
Attorney-in-Fact
Regional Operations Manager

CRO/dj

NOTICE OF INTENT

1. Name and address of the person making the discharge. _____

Meridian Oil Gathering, Inc.

P.O. Box 4289

Farmington, NM 87401

Telephone: (505)326-9700

2. Location of the discharge (in Township, Range and Section, $\frac{1}{4}$, $\frac{1}{4}$, $\frac{1}{4}$, if available). _____

Gobernador Compressor Station

NW/4 Section 31, T30N, R7W

Rio Arriba County, New Mexico (see attached plat)

3. Type of discharge. (1) Wash-down water; (2) Used Lube Oil; and (3) Pipeline
liquids - (see attached disposal plan)

4. The means of discharge (To a lagoon, Flowing Stream, Water Course, Arroyo,
Septic Tank-Leach field, other - Specify). Above ground steel tanks, on site, and
then hauled to final disposal site (see attached disposal plan).

5. The type of operation from which the discharge is derived. Field compression
of natural gas through a pipeline.

6. The estimated flow to be discharged per day. (1) 3500 gallons per month;
(2) 330 gallons per month; and (3) 3000 gallons per month.

7. The estimated depth to ground water (if available). Greater than 25 feet.

Signed: _____ Date: _____

GOBERNADOR COMPRESSOR STATION
DISPOSAL PLAN

The Gobernador station will be a field compression facility, which will be used in the gathering of Fruitland Coal gas. There will be liquid waste as a result of the operation of this station. Following is a description of these waste fluids and the disposal plan for each.

WASH-DOWN WATER:

Fresh water will be used to clean or wash-down the compressors and engines, and the floor of the compressor building. The contaminants will be dirt and small amounts of lubricating oil, which may spill onto the floor of the compressor building during routine maintenance. It is estimated that the usage rate of wash-down water will be 3,500 gallons (83 bbl) per month.

There are floor drains in the compressor building, which will allow the wash-down water to gravity drain into an underground sump tank. This sump tank is a double walled steel tank, which includes a leak detection system. This sump tank has a capacity of 375 gallons. This sump tank will be continually pumped down, with the water being pumped into an above ground vertical tank (capacity 8,400 gallons). This water will finally be trucked to an approved disposal well.

USED LUBRICATING OIL:

In the routine maintenance of the compressor engines the lubricating oil will be changed out, resulting in used lube oil. The oil in the engines will be changed approximately every three months, which is a rate of used oil of 330 gallons (8 bbl) per month.

When the engine oil is changed, the used lube oil will gravity drain from the engines into the underground sump tank. The used lube oil will be sold to a recycling contractor, who will truck the oil off location. This contractor will be approved by the New Mexico Environmental Improvement Division in the hauling and final disposition of the used oil. The used oil will finally be recycled by the contractor.

PIPELINE LIQUIDS:

As the gas stream enters the station, all free liquids are separated out before the gas enters the compressors. These liquids will be pumped into a separate above ground vertical tank. This tank will also have a capacity of 8,400 gallons.

Gobernador Compressor Station
Disposal Plan
page 2

Any free liquid from the pipeline will consist almost entirely of water that condenses out of the gas, as it travels through the pipe. The estimated rate of condensed water is 3000 gallons (71 bbl) per month. Due to the dry nature of this gas, no liquid hydrocarbons will be present. An extremely small trace of corrosion inhibitor is the only other fluid expected. This condensed water will be suitable for pumping into a disposal well, and will be trucked to such a facility.

Produced water will not normally be present in the pipeline, as all Fruitland Coal gas gathered into this system will be dehydrated before it enters the pipeline. If there is a failure of a dehydration unit and produced water does enter the pipeline; this water will be separated out at the station. Any such produced water will be trucked back to the field and disposed of in a well designated for produced water from the Fruitland Coal.
