1.0 INTRODUCTION AND SITE BACKGROUND

The site is located approximately 15 miles west of the town of Hobbs, New Mexico in the NW ¼ of the SE ¼ of Section 18, Township 18 South, Range 36 East. For reference, a site location and site map, are provided as Figures 1 and 2, respectively. The contents of this report are intended to fulfill requirements in accordance with 19 NMAC 15.A19.E (3) and 19.E (4) of the New Mexico Administrative Code (NMAC).

Initial site investigation actions were performed for the EOTT Energy Corporation (EOTT) by other environmental consultants. A total of 25 soil borings/groundwater monitor wells were installed (MW-1 through MW-25) prior to October 1999. Environmental Technology Group, Inc. (ETGI), representing EOTT, assumed control of remedial action planning and oversight responsibility with groundwater gauging and sampling duties in August of 1999. Review of the analytical results following quarterly groundwater monitoring events commencing on this date indicate that the dissolved phase contaminant plume present in the groundwater is not adequately delineated as required by the New Mexico Oil Conservation Division (NMOCD). ETGI is submitting this Modified Stage II Abatement Plan to document remedial actions completed at the site since August 1999 and to propose additional response actions designed to fulfill requirements necessary to complete plume delineation and achieve site closure as set in a verbal agreement between Mr. Bill Olsen and Mr. Randy Bayliss of the NMOCD and representatives for EOTT. In addition, this report complies with regulations as established by the State of New Mexico under NMAC Title 19 standards. The regulatory basis for this Modified Stage II Abatement Plan is 19 NMAC 15.A19 (3) and the NMOCD guidance document Guidelines for Remediation of Leaks, Spills, and Releases, (August 1993).

A review of the data existing for this site indicated the following:

- The soil column consists primarily of loose sand with silty to clay rich layers of limited aerial extent and caliche located irregularly through out the section;
- Hydrocarbon impacted soil is located at or just above the capillary fringe zone in the vadose zone;
- Groundwater at the site occurs at a depth of approximately 56 to 60 feet below grade surface (bgs) as measured from the top of existing well casings;
- The groundwater gradient at the site is approximately 0.003 ft/ft to the southeast;
- The concentration of benzene present in the downgradient well was above the NMOCD regulatory standard indicating that the impacted site groundwater has not been adequately delineated;
- There is no evidence of phase separated hydrocarbons (PSH) present in the soil or groundwater at the site.

2.0 SUMMARY OF RECENT FIELD ACTIVITIES

A total of six monitor wells were installed between May 2000 and December 2001 to further delineate the downgradient extent of impacted groundwater at the site. Benzene concentrations detected in samples collected from downgradient monitor wells MW-26 and MW-28 exceeded NMOCD regulatory standards which necessitated the installation of monitor wells MW-29 through MW-31 located in relative downgradient positions, (Figure 3). Review of the laboratory results generated from the initial sampling event conducted on these wells indicated that the dissolved phase benzene plume had reached this area and that plume delineation activities remain incomplete, (Figure 4). Discussion of plans to install additional soil borings and groundwater monitor wells to complete site soil characterization and groundwater delineation is included in Section 5.0 of this Report. Results of the soil and groundwater sampling associated with completion of the plume delineation activity will be submitted under separate cover for review to the appropriate NMOCD offices upon completion. Boring logs reflecting site lithology data and well completion details are included as Appendix A. Cumulative groundwater elevation, soil sampling data and groundwater sampling data, as recorded since August 1999, are provided in Tables 1, 2 and 3, respectively. A groundwater gradient map reflecting data gathered during the most recent monitoring event is attached as Figure 3. Copies of the laboratory reports generated from well installation and sampling activities described herein are included as Appendix B. All soil samples were submitted under chain-of-custody documentation to Environmental Lab of Texas of Odessa, Texas and analyzed for total petroleum hydrocarbons (TPH) utilizing EPA SW 846-8015M GRO/DRO. Selected soil samples were analyzed for Benzene, Toluene, Ethyl benzene and Xylenes (BTEX) utilizing EPA SW 846-8020, and 5030. Groundwater samples were submitted under chain-of-custody documentation and analyzed for required analyts by the methods listed below:

- BTEX constituents using EPA Method SW 846-8021B or BTEX constituents by EPA Method SW846-8260;
- Total Dissolved Solids (TDS) using EPA Method SW 846-160.1;
- Water Quality Metals using EPA Method SW 846-6010, 200.7;
- Chlorides using EPA Method SW 846-9253, and;
- Cations and Anions using EPA Methods 375.4, 325.3 and 310.

3.0 GEOLOGY/HYDROGEOLOGY

3.1 Site Geology/Hydrogeology

A comprehensive site description and analysis of site geologic and hydrologic conditions is not available at this time due to the lack of soil boring / monitor well installation details associated with site characterization work performed by other environmental consultants prior to August 1999. Refer to Section 5.0, Summary and Conclusions, of this report for the proposed drilling program designed to complete site subsurface soil characterization action. Analysis of soil boring logs and core sample laboratory testing results generated from the proposed additional drilling will provide a representative presentation of subsurface properties. At this time, a description of the site geologic / hydrologic conditions will be

limited to specific data gathered during dissolved phase plume delineation actions conducted in the southeastern area of the site and a review of available published data covering this area.

The surface unit consists of a tan to brown, very fine-grained, well sorted sand with calcareous nodules from 5 to 20 feet thick. It is underlain by a discontinuous layer of light gray indurated caliche varying in thickness from 15 to 20 feet thick. A reddish brown, very fine grained discontinuous sand from 20 to 30 feet thick underlies this unit. Groundwater was encountered in this unit at depths varying from 59 feet bgs to 62 feet bgs. In the site vicinity, the surface is composed of unconsolidated wind blown sands and finer materials associated with the Tertiary Ogallala Formation, which serves as a major aquifer for southeastern New Mexico and several High Plains states. Unconfined groundwater is typically present in these sands at varying depths and generally flows from the north to the south. This aquifer is typically characterized by relatively high hydraulic conductivity and transmissivity.

The Ogallala unconformably overlies the Triassic Dockum Group, locally referred to as the "red beds". While sand lenses are present within the Dockum Group, it is typically classified as an aquitard characterized by red silt and micaceous clay in which detectable groundwater is often absent or limited in extent. Where groundwater is present, the aquitard is usually characterized by relatively low hydraulic conductivity and transmissivity.

The site is located in the Southern High Plains physiographic feature as classified in the Lea County Soil Survey by the U.S. Department of Agriculture Soil Conservation Service, January 1974. The average surface elevation in the area ranges between 3,600 to 4,200 feet above sea level with the average surface topography sloping to the south and southeast at approximately 10 feet per mile. The groundwater gradient in the region appears to reflect the topography with a similar slope to the south and southeast with some local variations. The site is located on Kimbrough-Lea complex type soils, which consist of nearly level and gently sloping, gravelly and loamy soil underlain by shallow indurated caliche. This complex varies from approximately 50 percent Kimbrough gravelly loam, 25 percent Lea loam and 25 percent inclusions of Stegall, Arvana, Slaughter and Sharvana soils. The Kimbrough soil is gently sloping and is located on the tops and sides of low ridges while the Lea soil is nearly level and found in swales between the ridges. This soil complex has a rapid water intake and wind erosion is a severe hazard in the region.

Data collected by the United States Weather Bureau indicate that the average annual precipitation in the site vicinity is approximately 12 to 15 inches. This amount occurs primarily as storm events during the period between June and October. Infiltration and evaporation rates are generally high, resulting in limited surface flow from these events. The primary utilization of these lands consists of range, wildlife habitat, and recreational areas. State records, maintained by the New Mexico State Engineer's Office, indicate that the depth to groundwater in the area varies from approximately 25 to 62 feet bgs (Appendix D). The only surface-water body identified in the area is characterized by the U.S. Department of Agriculture as an intermittent lake located approximately 500 feet northwest of the site.

3.2 New Mexico Oil Conservation Division (NMOCD) Soil Classification

Impacted soil at depth is characterized in the NMOCD guidelines as Unsaturated Contaminated Soils. Review of the field data and available state records indicate that the interval between the base of soil contamination and the upper limit of the water table is less than 50 feet, therefore, 20 points would be assigned to the site as a result of this criterion.

The water well database, maintained by the New Mexico State Engineer's Office, was accessed in order to determine the location and type of nearby water wells in the area (Appendix C). The data indicate that there is one water well located within 1,000 feet of the site, therefore, 20 points would be assigned to the site as a result of this criterion.

Figure 1 indicates that there is intermittent surface water within 500 feet of the site. Based on the NMOCD soil classification system 10 points would be assigned to the site as a result of this criterion. The NMOCD guidelines indicate that the site would have a Ranking Score of >19. The action levels for a site with a Ranking Score of >19 points are as follows:

- Benzene - 10 ppm
- BTEX - 50 ppm
- TPH - 100 ppm

3.3 Distribution of Hydrocarbons in the Unsaturated Zone

Soil encountered at depth during the installation of monitor wells MW-26 and MW-28 is considered Unsaturated Contaminated Soil as characterized by NMOCD guidelines due to elevated TPH constituent concentrations. None of the soil samples submitted for analysis from monitor wells MW-26, MW-27 or MW-28 exceed regulatory standards for BTEX constituents. Soil samples collected from monitor well MW-26 contained TPH concentrations above NMOCD regulatory standards as follows: 679 mg/Kg at 40 feet bgs, 1832 mg/Kg at 45 feet bgs, 1570 mg/Kg at 50 feet bgs and 515 mg/Kg at 55 feet bgs. Monitor well MW-28 soil samples contained TPH concentrations exceeding regulatory standards as follows: 743 mg/Kg at 45 feet bgs, 1336 mg/Kg at 50 feet bgs and 1386 mg/Kg at 55 feet bgs. All other soil samples collected from monitor wells MW-27, MW-29, MW-30 and MW-31 were below regulatory levels for BTEX and TPH constituents (Table 2).

The distribution of hydrocarbons in the unsaturated zone has been estimated by utilizing the following techniques:

- Visual observations of subsurface soil samples, and;
- Review of laboratory analyses of soil samples.

3.4 Distribution of Hydrocarbons in the Saturated Zone

Nineteen of the monitor wells located on-site are impacted with dissolved phase benzene or total BTEX constituents above NMOCD regulatory standards. There are no known phase separated hydrocarbons associated with this site. Dissolved phase benzene concentrations exceeding NMOCD regulatory standards recorded from laboratory analysis of groundwater

samples collected during calendar year 2001 varied from a minimum of 0.011 mg/L in MW-2 to a maximum of 7.140 mg/L in MW-14. Review of the cumulative analytical results from groundwater sampling events indicate that benzene and total BTEX concentrations fluctuate at the site. Groundwater in downgradient monitor well MW-29 is impacted with a dissolved phase benzene concentration of 2.340 mg/L indicating that downgradient plume delineation activities are incomplete.

Results of laboratory analyses of regulated metal constituents in the groundwater were below the New Mexico Water Quality Control Commission regulatory standards for all tested analytes.

4.0 ABATEMENT OPTIONS

4.1 Soil Abatement Options

An accurate estimate of the volume of impacted soil present at the site is not available utilizing existing data. Operational issues associated with the remedial technology are described in order to rate the viability of the technology considered.

Abatement of impacted soil at the site is proposed using the following technology:

- Human-Health Based Risk Assessment.

As per the verbal agreement between the NMOCD and representatives of EOTT during a site visit in 2001, the groundwater contaminant plume will be fully defined, additional source area information collected, and a risk assessment completed and submitted to the NMOCD. The groundwater plume will be monitored on a quarterly basis for the near term, following NMOCD approval, and pending the results of the risk based analysis of the site, monitoring frequency may be reduced.

The technology selected to meet NMOCD regulatory cleanup standards is that of a Human-Health Based Risk Assessment technology. A site-specific approach will be employed to assess the probability of likely human exposure pathways with evaluations of the individual constituents of BTEX and TPH concentrations present in the soil. Site Specific Target Levels (SSTL) will be determined using risk assessment technology, and the existing site conditions at that time compared to the SSTL's to evaluate the success or efficiency of the chosen remedial methodology.

4.2 Groundwater Abatement Options

As per the verbal agreement between the NMOCD and representatives of EOTT during a site visit in 2001, the groundwater pump-and-treat system will be removed and extended monitoring instituted at the site. The groundwater contaminant plume will be fully defined and a risk assessment completed and submitted to the NMOCD. The groundwater plume will be monitored on a quarterly basis for the near term, following NMOCD approval, and pending the results of the risk-based analysis of the site, monitoring frequency may be adjusted.

Abatement of impacted groundwater at the site is technically feasible using the following technologies:

- Human-Health Based Risk Assessment
- Natural Attenuation
- Deed Recordation of Impacted Area Against Groundwater Use

The remedial technology selected to meet NMOCD regulatory cleanup standards at this site is utilization of a Human-Health Based Risk Assessment technology. A site-specific approach will be employed to assess the probability of likely human exposure pathways with evaluations of the individual constituents of TPH concentrations present in the soil and BTEX constituents present in the groundwater. Analytical fate-and-transport modeling will provide a means of estimating exposure concentrations and developing risk-based soil and groundwater remediation standards. Under ASTME E-1739 "Standard Guide for Risk-Based Corrective Action Applied at Petroleum Release Sites," modeling is recommended as a conservative first step under Tiers 1 and 2 of the site evaluation process, prior to use of more complex numerical modeling methods under Tier 3.

Natural attenuation will be monitored and used to estimate the degradation rates of the dissolved phase product plume. Dissolved oxygen, pH, temperature, sulfates, carbon dioxide and nitrate will be measured in all monitor wells sampled during each groundwater sampling event to quantify the presence and rate of biodegradation of the dissolved phase contaminant plume.

In order to prevent subsequent unintended or accidental human exposure to petroleum hydrocarbon constituents remaining on-site following risk based closure (if granted), the specific site area will be deed restricted preventing future consideration of development or improvements in the county clerk office, Lovington, Lea County, New Mexico.

5.0 SUMMARY AND CONCLUSIONS

The site has an NMOCD Ranking Score of >19 points. The soil action levels for a site with this score are as follows:

- Benzene - 10 ppm
- BTEX - 50 ppm
- TPH - 100 ppm

A total of six groundwater monitor wells, MW-26 through MW-31, were installed within the time frame of events described in this report. Soil classified as Unsaturated Contaminated Soil by NMOCD Guidelines (August 1993) was discovered at depth in monitor wells MW-26 and MW-28.

Soil located at depths varying between 40 and 55 feet bgs in the area of monitor wells MW-26 and MW-28 appeared to be Unsaturated Contaminated Soil as characterized by NMOCD

guidelines (August 1993). BTEX concentrations recorded in all of the soil samples analyzed were below applicable regulatory standards. Analysis of the soil samples collected from monitor well MW-26 at the above referenced depths contained TPH concentrations varying from 36 mg/Kg to 1832 mg/Kg. Laboratory results from samples collected at monitor well MW-28 at the above referenced depths registered TPH concentrations ranging from 93 mg/Kg to 1386 mg/Kg. None of the soil samples collected from monitor wells MW-27, MW-29, MW-30 and MW-31 registered BTEX or TPH concentrations above regulatory standards. Site excavation technologies are not feasible at this site due to the estimated 500,000 cubic yards of overburden material that would have to be excavated to access the impacted soil.

During the first quarterly monitoring event conducted in calendar year 2002, the dissolved phase benzene concentrations in groundwater samples collected from monitor wells MW-26, MW-27, MW-28, MW-29, MW-30 and MW-31 were 1.690 mg/L, 0.004 mg/L, 2.130 mg/L, 2.340 mg/L, <0.001 mg/L and 0.002 mg/L, respectively. These results indicate that the down-gradient extent of the plume has not been delineated. The dissolved phase benzene concentration in select monitor wells on-site has historically registered concentrations above the NMOCd regulatory standard. Phase separated hydrocarbons have never been detected in any on-site groundwater monitor wells. Results of groundwater sampling for New Mexico Water Quality Control Commission metals were below regulatory levels. Refer to Table 2, Groundwater Chemistry, for concentrations of WQCC metals in on-site groundwater.

Based on the field data, the average depth to groundwater at the site is approximately 56 to 60 feet bgs. Data from the New Mexico State Engineer's Office indicate that the depth to groundwater in the general area is approximately 25 to 59 feet bgs.

An accurate estimate of the volume of impacted soil present at the site is not available utilizing existing site data. A soil delineation survey utilizing either an air rotary drilling rig or a hollow stem auger rig will be conducted by installing approximately ten 60-foot deep soil borings at the points shown on Figure 5. Soil borings 9 and 10 will be subsequently converted to a permanent groundwater monitor wells for downgradient groundwater delineation purposes. Core samples will be collected from the capillary fringe zone of selected soil borings and analyzed as outlined in Section 7.1 of this report. Information gained from laboratory analysis of core sampling will be utilized in the estimation of hydraulic parameters needed for completion of a risk based assessment.

ETGI recommends utilization of a risk based assessment technology to achieve site closure. The following assumptions and observations qualify this site for eventual closure from the NMOCd utilizing a human-health risk based assessment technology:

- Exposure Setting: depth to the impacted soil >45 feet bgs and impacted groundwater >55 bgs;
- At Risk Population: environmental technicians only, assuming no site excavation activity; technicians, heavy equipment operators, laborers, site supervisory personnel and local downwind population if site excavation is conducted;
- Exposure Pathways: soil sampling during groundwater monitoring well/soil boring installations and groundwater sampling during regularly scheduled monitoring events, and;

- Exposure Points: soil and groundwater possibilities to the at-risk population identified above.

At this time, the existence of a threat to human exposure to petroleum hydrocarbon impacted soil at this site is limited. Personnel associated with additional on-site plume delineation actions are OSHA trained, experienced in soil and groundwater investigation and sampling methods and will be utilizing personal protective equipment while conducting site investigation activities. The existing SPS water well should be properly plugged and abandoned according to applicable WQCC well closure standards. Filing of Deed Restriction documentation restricting future development or improvements to the area defined in this report in the county clerks office in Lovington, Lea County, New Mexico will reduce human exposure to the regulated constituents on-site to accepted Risk Based Standards.

6.0 MONITORING PROGRAM

All site monitoring wells will be gauged and sampled on a continuing quarterly basis. Each well will be monitored for the presence of PSH and/or depth to groundwater. All of the groundwater monitoring wells, with the exception of those registering a presence of PSH, will be purged and sampled for dissolved phase BTEX constituents. Groundwater sampling methodology proposed at this site is described in Section 7.2, Groundwater Sampling of this report.

The quarterly groundwater monitoring data will be compiled and summarized in an annual report. The annual report will be submitted prior to April 1 of the following calendar year according to NMOC guidelines.

7.0 QA/QC PROCEDURES

7.1 Soil Sampling

Samples of subsurface soils will be obtained utilizing a split spoon sampler. Representative soil samples will be divided into two separate portions using clean, disposable gloves and clean sampling tools. One portion of the soil sample will be placed in a zip-lock baggie. The baggie will be labeled and sealed for headspace analysis using a photoionization detector calibrated to a 100-ppm isobutylene standard. Each sample will be allowed to volatilize for approximately thirty minutes at ambient temperature prior to conducting the analysis. The soil sample registering the highest PID reading and any sample with a PID reading greater than or equal to 100 ppm will be selected for laboratory analysis.

The other portion of the soil sample will be placed in a duplicate zip-lock baggie and temporarily stored on ice. Upon selection of samples for analysis, the sample will be transferred from the temporary storage baggie to a sterile glass container equipped with a Teflon-lined lid furnished by the analytical laboratory. The container will be filled to capacity to limit the amount of headspace present. Each container will be labeled and placed on ice in an insulated cooler and sealed for shipment to the laboratory. Proper chain-of-custody documentation will be maintained throughout the sampling process.

Soil samples will be delivered to Environmental Lab of Texas, in Odessa, Texas for BTEX, TPH, and Water Quality Metals analyses using the methods described below. All samples will be analyzed within the appropriate holding times following the collection date.

- BTEX concentrations in accordance with EPA SW 846 Method 8021B, 5030, and;
- TPH concentrations in accordance with EPA SW 846 Method 8015M GRO/DRO.
- NMWQCC regulated metals in accordance with EPA SW Methods 6010B and 7470.

Core samples will be collected utilizing a Shelby tube sampling device, wrapped in plastic and sealed with duct tape. The core sample will be delivered to South West Laboratory, Inc. in Houston, Texas and analyzed for:

- Hydraulic Conductivity in accordance with ASTM Method D5084;
- Moisture Content in accordance with ASTM Method D2216;
- Wet and Dry Bulk Density in accordance with ASTM Method D2937, and;
- Fractional Organic Carbon in accordance with ASTM Method D2974

7.2 Groundwater Sampling

After purging the wells, groundwater samples will be collected with a disposable Teflon sampler and polyethylene line by personnel wearing clean, disposable gloves. Groundwater sample containers will be filled in the order of decreasing volatilization sensitivity (i.e., BTEX containers will be filled first, poly aromatic hydrocarbons (PAH) containers second and RCRA metals last).

Groundwater samples collected for BTEX analysis will be placed in 40 ml glass VOA vials equipped with Teflon lined caps, provided by the analytical laboratory. The vials will be filled to a positive meniscus, sealed, and visually checked to ensure the absence of air bubbles.

The filled containers will be labeled and placed on ice in an insulated cooler. The cooler will be sealed for transportation to the analytical laboratory. Proper chain-of-custody documentation will be maintained throughout the sampling process.

Groundwater samples will be delivered to Environmental Lab of Texas, in Odessa, Texas for analyses using the methods described below. All groundwater samples collected from existing monitoring wells will be analyzed for dissolved-phase BTEX concentrations in accordance with EPA Method 8021B, 5030. All groundwater samples collected from the newly installed monitoring wells will be analyzed for:

- BTEX constituents in accordance with EPA Method 8021B, 5030;
- PAH in accordance with EPA Method 8270;
- Total dissolved solids in accordance with EPA Method 160.1;
- Anions and cations in accordance with EPA Methods 300 and 6010, and;

- RCRA metals in accordance with EPA Method 6010B, 7470.

7.3 Decontamination Of Equipment

Cleaning of drilling equipment is the responsibility of the drilling company. In general, the cleaning procedures will consist of using high-pressure steam to wash the drilling and sampling equipment prior to drilling and prior to starting each hole. Prior to use, the split spoon sampling tool will be cleaned with Liqui-Nox® detergent and rinsed with distilled water.

7.4 Laboratory Protocol

The laboratory will be responsible for proper QA/QC procedures after signing the chain-of-custody form. These procedures are either transmitted with the laboratory reports or are on file at the laboratory.

8.0 LIMITATIONS

Environmental Technology Group, Inc. has prepared this Additional Subsurface Investigation Report and Modified Stage II Abatement Plan to the best of its ability. No other warranty, expressed or implied, is made or intended.

Environmental Technology Group, Inc. has examined and relied upon documents referenced in the report and has relied on oral statements made by certain individuals. Environmental Technology Group, Inc. has not conducted an independent examination of the facts contained in referenced materials and statements. We have presumed the genuineness of the documents and that the information provided in documents or statements is true and accurate. Environmental Technology Group, Inc. has prepared this report in a professional manner, using the degree of skill and care exercised by similar environmental consultants. Environmental Technology Group, Inc. also notes that the facts and conditions referenced in this report may change over time and the conclusions and recommendations set forth herein are applicable only to the facts and conditions as described at the time of this report.

This report has been prepared for the benefit of EOTT. The information contained in this report, including all exhibits and attachments, may not be used by any other party without the express consent of Environmental Technology Group, Inc. and/or EOTT.

Analytical and Quality Control Report

Ken Dutton
ETGI
2540 W. Marland
Hobbs, NM

Report Date: June 25, 2001

Order ID Number: A01061809

Project Number: EOT 2022C
Project Name: SPS-11
Project Location: Lea County, NM

Enclosed are the Analytical Results and Quality Control Data Reports for the following samples submitted to TraceAnalysis, Inc.

Sample	Description	Matrix	Date Taken	Time Taken	Date Received
173437	MW-1	Water	6/6/01	10:10	6/16/01
173438	MW-2	Water	6/6/01	10:40	6/16/01
173439	MW-3	Water	6/6/01	11:00	6/16/01
173440	MW-4	Water	6/6/01	14:57	6/16/01
173441	MW-6	Water	6/6/01	11:30	6/16/01
173442	MW-7	Water	6/6/01	14:47	6/16/01
173443	MW-9	Water	6/6/01	12:00	6/16/01
173444	MW-10	Water	6/6/01	14:40	6/16/01
173445	MW-11	Water	6/6/01	15:09	6/16/01
173446	MW-12	Water	6/6/01	13:15	6/16/01
173447	MW-13	Water	6/6/01	13:10	6/16/01
173448	MW-14	Water	6/6/01	13:20	6/16/01
173449	MW-15	Water	6/6/01	13:27	6/16/01
173450	MW-16	Water	6/6/01	13:35	6/16/01
173451	MW-17	Water	6/6/01	16:15	6/16/01
173452	MW-18	Water	6/6/01	14:20	6/16/01
173453	MW-19	Water	6/6/01	14:30	6/16/01
173454	MW-20	Water	6/6/01	14:10	6/16/01
173455	MW-21	Water	6/6/01	13:55	6/16/01
173456	MW-22	Water	6/6/01	13:00	6/16/01
173457	MW-23	Water	6/6/01	12:45	6/16/01
173458	MW-24	Water	6/6/01	12:30	6/16/01
173459	MW-25	Water	6/6/01	12:15	6/16/01
173460	MW-26	Water	6/6/01	15:30	6/16/01
173461	MW-27	Water	6/6/01	15:45	6/16/01
173462	MW-28	Water	6/6/01	16:00	6/16/01
173463	EB-1	Water	6/6/01	16:30	6/16/01

These results represent only the samples received in the laboratory. The Quality Control Report is generated on a batch basis. All information contained in this report is for the analytical batch(es) in which your sample(s) were analyzed.

This report consists of a total of 17 pages and shall not be reproduced except in its entirety including the chain of custody (COC), without written approval of TraceAnalysis, Inc.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PRREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

REPORT OF SURROGATE RECOVERY

Surrogate Compound	Method	Recovery	Recovery Limit	Data Qualifiers
1,2-Dichloroethane-d4	8260b	106	80-120	---
Toluene-d8	8260b	92.3	88-110	---

Data Qualifiers: D = Surrogates diluted and X = Surrogates outside advisory recovery limits.

Exceptions Report:

Report #/Lab ID#: 120072	Matrix: water
Client: Environmental Tech Group	Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C	
Sample Name: MW 2	

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (e.g. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
Ethylbenzene	J	See J-flag discussion above.
m,p-Xylenes	J	See J-flag discussion above.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

Exceptions Report:

Report #/Lab ID#: 120077 Matrix: water
Client: Environmental Tech Group Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C
Sample Name: MW 9

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
o-Xylene	J	See J-flag discussion above.
Toluene	J	See J-flag discussion above.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

REPORT OF SURROGATE RECOVERY

Surrogate Compound	Method	Recovery	Recovery Limit	Data Qualifiers
1,2-Dichloroethane-d4	8260b	80.3	80-120	---
Toluene-d8	8260b	97.1	88-110	---

Data Qualifiers: D = Surrogates diluted and X = Surrogates outside advisory recovery limits.

Exceptions Report:

Report #/Lab ID#: 120086	Matrix: water
Client: Environmental Tech Group	Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C	
Sample Name: MW 18	

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCCT-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
Ethylbenzene	J	See J-flag discussion above.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limits. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

Client: Environmental Tech Group		
Project ID: SPS_11 EOT 2022C		
Sample Name: MW 22		

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

QUALITY ASSURANCE DATA¹

Report#/Lab ID#: 120096 Report Date: 10/12/01
 Project ID: SPS-11 EOT 2022C

Sample Name: MW 28
 Sample Matrix: water
 Date Received: 10/02/2001 Time: 16:31
 Date Sampled: 09/28/2001 Time: 17:00

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL, B = Analyte detected in associated method blank(s), S1 = MS and/or MSD recovery exceed advisory limits, S2 = Post digestion spike (PDS) recovery exceeds advisory limit, S3 =MS and/or MSD recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

This analytical report is respectfully submitted by AnalySys, Inc. The enclosed results have been carefully reviewed and, to the best of my knowledge, the analytical results are consistent with AnalySys, Inc.'s Quality Assurance/Quality Control Program. © Copyright 2000, AnalySys, Inc., Austin, TX. Report #/Lab ID#: 122714	Matrix: water
Client: Environmental Tech Group	Attn: Ann Moore
Project ID: SPS 11 EQT 2022C	
Sample Name: MW 2	

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (e.g. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
o-Xylene	J	See J-flag discussion above.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

Project ID: SPS 11 EOT 2022C
Sample Name: MW 6

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (e.g. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
Toluene	J	See J-flag discussion above.

Exceptions Report:

Report #/Lab ID#: I22722	Matrix: water
Client: Environmental Tech Group	Attn: Ann Moore
Project ID: SPS 11 EOT 2022C	
Sample Name: MW 12	

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg., the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
o-Xylene	J	See J-flag discussion above.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 = MS and/or MSD recovery exceed advisory limits. S2 = Post digestion spike (PDS) recovery exceeds advisory limit. S3 = MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

Sample Name: MW 21

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (e.g. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
o-Xylene	J	See J-flag discussion above.

1. Quality assurance data is for the sample batch which included this sample.
2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements.
3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample.
4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix.
5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method.
6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions.
7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

REPORT OF SURROGATE RECOVERY

Surrogate Compound	Method	Recovery	Recovery Limit	Data Qualifiers
1,2-Dichloroethane-d4	8260b	93.2	80-120	---
Toluene-d8	8260b	100	88-110	---

Data Qualifiers: D= Surrogates diluted and X= Surrogates outside advisory recovery limits.

Exceptions Report:

Report #/Lab ID#: 122735 Matrix: water
Client: Environmental Tech Group Attn: Ann Moore
Project ID: SPS 11 EOT 2022C
Sample Name: MW 25

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of targetions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment

(1) Unless specifically requested otherwise on this Chain-of-custody and/or attached documentation, all analyses will be conducted using ASI's method of choice and all data will be reported to ASI's normal reporting limits (MDL/PQL). For GC/MS volatiles and extractables, unless specific analytical parameter lists are specified on this chain-of-custody or attached to this chain-of-custody, ASI will default to Priority Pollutants or ASI's HSL list at ASI's option. Specific compound lists must be supplied for all GC procedures.

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 = MS and/or MSD recovery exceed advisory limits. S2 = Post digestion spike (PDS) recovery exceeds advisory limit. S3 = MS and/or MSD and PDS recoveries exceed advisory limits. P = Precision higher than advisory limit. M = Matrix interference.

Client: Environmental Tech Group	Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C	
Sample Name: MW 2	

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samplers (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
Benzene	J	See J-Flag discussion above.
Toluene	J	See J-Flag discussion above.

Client: Environmental Tech Group		Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C		
Sample Name: MW 7		

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment

QUALITY ASSURANCE DATA¹

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analytic recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (ROL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P = Precision higher than advisory limit. M =Matrix interference.

Project ID: SPS-11 EOT 2022C	
Sample Name: MW 13	

Sample Temperature/Condition $\leq 6^{\circ}\text{C}$

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is $\leq 6^{\circ}\text{C}$. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

1. Qualify assurance data is for the sample batch which included this sample.
2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements.
3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample.
4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix.
5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method.
6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions.
7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

REPORT OF SURROGATE RECOVERY

Surrogate Compound	Method	Recovery	Recovery Limit	Data Qualifiers
1,2-Dichloroethane-d4	8260b	114	80-120	---
Toluene-d8	8260b	101	88-110	---

Data Qualifiers: D= Surrogates diluted and X= Surrogates outside advisory recovery limits.

Exceptions Report:

Report #/Lab ID#: 127622 Matrix: water
Client: Environmental Tech Group Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C
Sample Name: MW 19

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 = MS and/or MSD recovery exceed advisory limits. S2 = Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

Exceptions Report:

Report #/Lab ID#: 127632 Matrix: water
Client: Environmental Tech Group Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C
Sample Name: MW 29

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Sample Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNRCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Respectfully Submitted,
Richard Laster
 Richard Laster

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limit. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P =Precision higher than advisory limit. M =Matrix interference.

This analytical report is respectfully submitted by AnalySys, Inc. The enclosed results have been carefully reviewed and, to the best of my knowledge, the analytical results are consistent with AnalySys, Inc.'s Quality Assurance/Quality Control Program. © Copyright 2000, AnalySys, Inc., Austin, TX. All rights reserved. No part of this publication may be reproduced or transmitted in any form or by any means without the express written consent of AnalySys, Inc.

Respectfully Submitted,
Richard Laster
Richard Laster

1. Quality assurance data is for the sample batch which included this sample. 2. Precision (PREC) is the absolute value of the relative percent (%) difference between duplicate measurements. 3. Recovery (Recov.) is the percent (%) of analyte recovered from a spiked sample. 4. Calibration Verification (CCV) and Laboratory Control Sample (LCS) results are expressed as the percent (%) recovery of analyte from a known standard or matrix. 5. Reporting Quantitation Limits (RQL), typically at or above the Practical Quantitation Limit (PQL) of the analytical method. 6. Method numbers typically denote USEPA procedures. Less than ("<") values reflect nominal quantitation limits adjusted for any required dilutions. 7. Data Qualifiers are J = analyte potentially present between the PQL and the MDL. B = Analyte detected in associated method blank(s). S1 =MS and/or MSD recovery exceed advisory limits. S2 =Post digestion spike (PDS) recovery exceeds advisory limits. S3 =MS and/or MSD and PDS recoveries exceed advisory limits. P = Precision higher than advisory limit. M =Matrix interference.

REPORT OF SURROGATE RECOVERY

Surrogate Compound	Method	Recovery	Recovery Limit	Data Qualifiers
1,2-Dichloroethane-d4	8260b	111	80-120	---
Toluene-d8	8260b	99.5	88-110	---
2-Fluorobiphenyl	8270c	46.9	43-116	---
Nitrobenzene-d5	8270c	41.1	35-114	---
Terphenyl-d14	8270c	50.9	33-141	---

Data Qualifiers: D= Surrogates diluted and X= Surrogates outside advisory recovery limits.

Exceptions Report:

Report #/Lab ID#: 127634	Matrix: water
Client: Environmental Tech Group	Attn: Ken Dutton
Project ID: SPS-11 EOT 2022C	
Sample Name: MW 31	

Sample Temperature/Condition <=6°C

The typical sample temperature criteria (except for metals by ICP, GFAA and AA and a very few other tests) is <= 6°C. Possible exceptions include samples submitted to laboratory within such a short time after sampling that cooling measures used in the field and during transport had insufficient time to achieve desired temperatures in the samples (see sample collection and sample receipt times) and samples where the temperature could not be measured due to sample submission in a manner precluding temperature measurement without impacting sample integrity (ex. in a bottle with no cooler).

Bottles & Preservation

- Sample received in appropriate container(s) and appear to be appropriately preserved.
- Sample received in appropriate container(s). State of sample preservation unknown.
- Sample received in inappropriate container(s) and/or with unknown state of preservation.

J flag Discussion

A J flag data qualifier indicates (as required under TNURCC-TRRP reporting requirements) that the raw calculated analyte concentration in the sample (uncorrected for background levels/blanks and other potential sources of sampling and analytical contamination), though less than the Reported Quantitation Limit (RQL) is greater than the Detection Limit. Because the reported result is below the quantitation limit for this project/sample (or test procedure), GC/MS organics results may or MAY NOT have been verified as to the presence and relative ratio of target ions (eg. the material causing the J flag "hit" in such situations may be nothing more than background ion-fragment noise.)

Comments pertaining to Data Qualifiers and QC data:

Parameter	Qualif	Comment
Copper/ICP	J	See J-flag discussion above.
Molybdenum/ICP	J	See J-flag discussion above.
Nickel/ICP	J	See J-flag discussion above.
Ethylbenzene	J	See J-flag discussion above.
m,p-Xylenes	J	See J-flag discussion above.
