**3-D Environmental, Inc. Project 110403**

Dear Mr. Davis:

3-D Environmental, Inc. (3-D) is pleased to submit this Report of Phase II Environmental Site Assessment and Site Remediation Work Plan at the Smith Services, Drilco facility located at 1120 West Bender Road in Hobbs, New Mexico. Acting on behalf of Smith International, Inc. (Smith), you authorized 3-D to perform the assessment services. The purpose of the assessment was to establish environmental baseline conditions at the facility. The findings of the field work and analytical results are presented in this report and a follow-up work plan has been developed to address surface soil remediation.

This report is intended for the exclusive use of Smith. Reliance on this document by any other party is forbidden without the express written consent of Smith and 3-D. Use of this report for purposes beyond those intended by 3-D will be at the sole risk of the user.

This report presents project information, which includes field procedures and limitations, along with the findings, conclusions, and recommendations. We appreciate your selection of 3-D for this project. If you have any questions, please do not hesitate to contact Kurt Lampi at (918) 298-7999.

Sincerely,  
**3-D Environmental, Inc.**

## **1.0 INTRODUCTION**

### **1.1 Purpose of Services**

The purpose of the Phase II Environmental Site Assessment (ESA) services at the Smith Services, Drilco facility located at 1120 West Bender Road in Hobbs, New Mexico was to establish environmental baseline conditions.

### **1.2 Scope of Services**

The Phase II ESA consisted of the following services:

- A site reconnaissance was conducted to identify areas of potential environmental impact. Areas of significance are soil stained areas, air compressors, product and waste storage areas, paint vents, wash water release points, soil covered areas directly beneath work areas, and areas near mandoors and overhead doors. Interviews were conducted with on-site personnel to obtain site history and past operating practices.
- Surface soil samples were collected between depths of 0.3 to 0.5 foot within biased locations of the Smith Services, Drilco facility. Biased locations are areas within the property where soil staining is present or at locations where soil impacts are possible due to the proximity to facility activities that were identified during the site reconnaissance.
- Soil samples were submitted for analysis to DHL Analytical Laboratory of Round Rock, Texas.
- A water well database, site geology, and other pertinent records were reviewed, as necessary, to complete the Phase II ESA report.
- Upon review of the field and the laboratory analytical data, a report was prepared summarizing the findings of the field assessment and providing a work plan for future site assessment and site remediation.

### **1.3 Qualifications and Limitations**

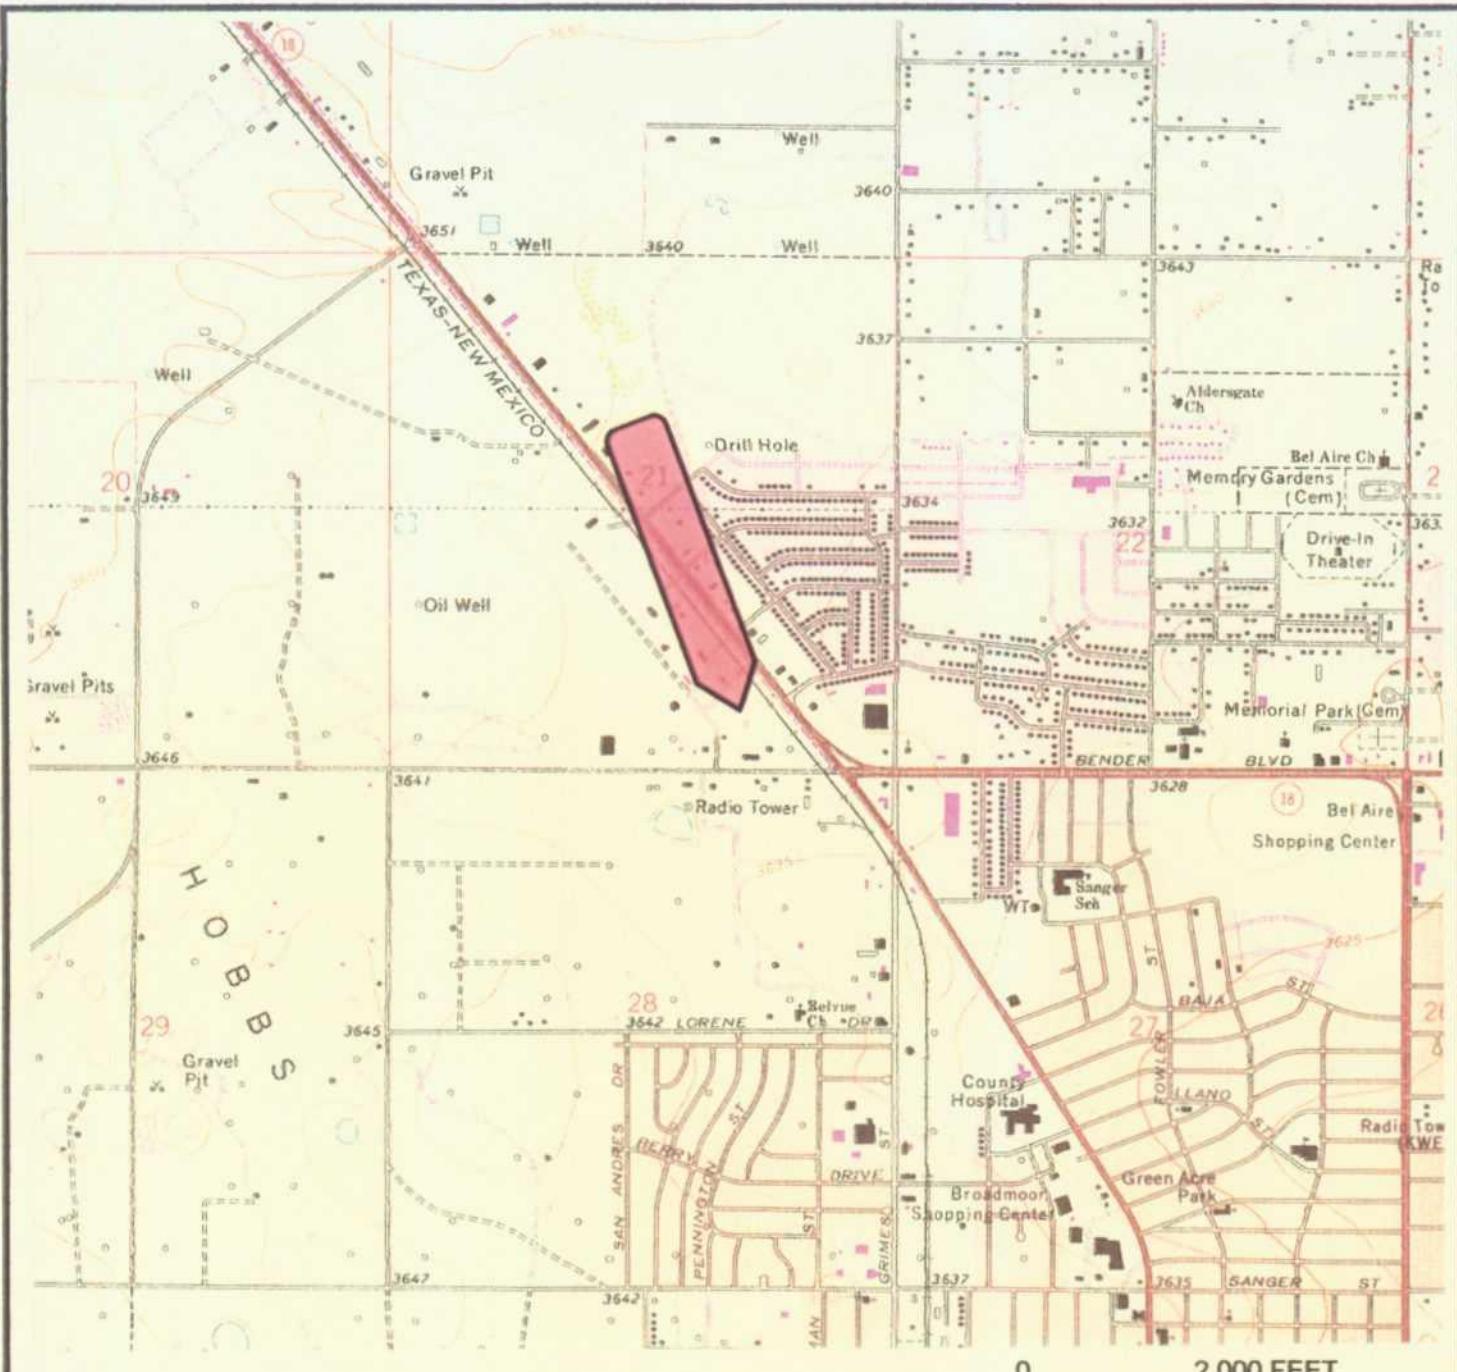

The findings and opinions presented are relative to the dates of the site work and should not be relied on to represent conditions at substantially later dates. The opinions included herein are based on information obtained during the current assessment and our experience. We have assumed that information gained from interviews was accurate unless our on site observations indicated otherwise. 3-D reserves the right to alter our findings based on our review of any information received after the date of this report.

Our professional services have been performed using that degree of care and skill ordinarily exercised, under similar conditions, by reputable environmental consultants practicing in this or similar localities. No other warranty, expressed or implied, is made as to the professional information contained in this report.

## **2.0 SITE CONCEPTUAL MODEL**

### **2.1 Property Use and Description**

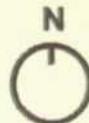

The Smith Services, Drilco facility (Drilco facility) is an eight – acre property located in the northwest portion of the city of Hobbs (please refer to Figure 1). Smith acquired the facility in the summer of 2001 when the company purchased Star Tool, a regional oil field service company. The facility was reportedly first developed in the early 1960s as Evans Machine, a machine shop enterprise that repaired downhole fishing tools and pump jack gear boxes. Ownership changed in 1985 when B & B Machine Shop, a Star Tool company, purchased the facility and discontinued the servicing of pump jacks. Smith ceased site operations in July 2004. Intended property use by Smith or future owners would be industrial.

**FIGURE 1**  
**SITE LOCATION MAP**

**Smith Services, Drilco Facility**  
**1120 West Bender Road**  
**Hobbs, New Mexico**

**3-D Project 110403**

The Drilco facility is an irregular shaped parcel and has 540 feet of frontage along West Bender Road (please refer to Figure 2 and the 1997 aerial photograph).

The latitude and longitude and physical address are as follows:

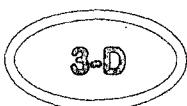

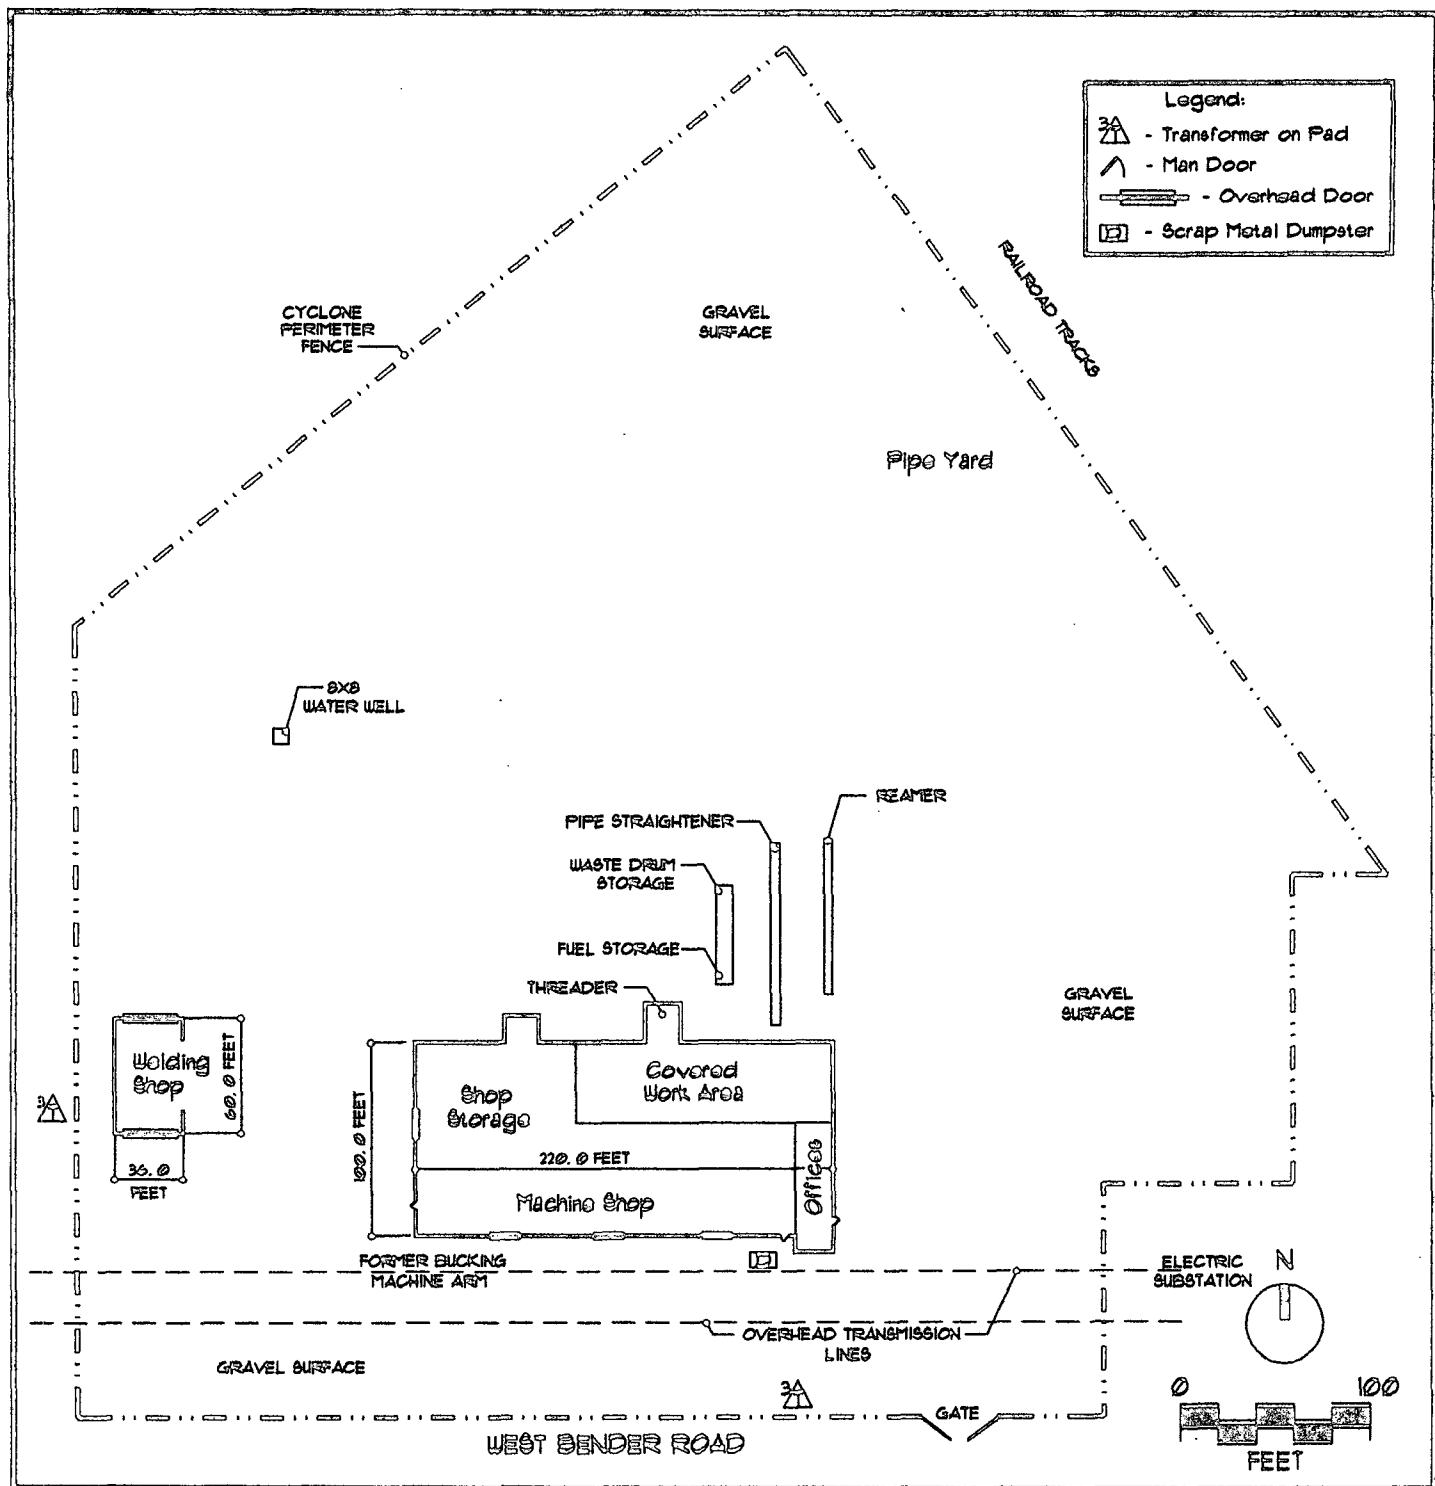

- Latitude and Longitude - 32°43'34" North and 103°08'56" West.
- Physical Address – 1120 West Bender Road, Hobbs, New Mexico 88240.

The facility is developed with two single-story, steel framed, metal walled and roofed buildings. The largest building paralleling Bender Road and centered along the south side of the facility contained a machine shop with an outside covered work area, a warehouse, and a paint booth. A smaller building located along the west side of the facility was a welding shop. The remaining surface areas of the property are gravel surfaced storage yard and access driveways.

## **2.2 Site and Vicinity Characteristics**

The site is located among other industrial properties along West Bender Road. Adjacent companies are:

- Pemco – an oil field services company, adjacent and north.
- Everett Foyt Welding, across West Bender Road to the south.
- Schlumberger, across West Bender Road to the south.
- An electrical substation, adjacent and east.
- Railroad right-of-way, adjacent and east.
- A warehouse for a uniform company, adjacent and west.

### 1997 AERIAL PHOTOGRAPH

**Smith Services, Drilco Facility  
1120 West Bender Road  
Hobbs, New Mexico**

3-D Project 110403

The United States Environmental Protection Agency (EPA) EnviroMapper database was reviewed on November 22, 2004 and an Environmental FirstSearch database was inspected on February 2, 2005 to identify registered EPA facilities on site and within the site vicinity (refer to Figure 3). The Drilco facility was identified as a conditional exempt small quantity generator under the business name of B & B Machine Shop, Inc. updated as of March 18, 1992. None of the other databases listed the Drilco address or identified Drilco.

Schlumberger, located across West Bender Road, was identified as a small quantity generator, an underground storage tank site, and an ERNS (a release site). One leaking underground storage tank (LUST) site listed was listed within the ASTM search radii<sup>1</sup>. The Hines Shell station located approximately 0.4 mile to the southeast at 2208 North Turner had a release in 1989 affecting soils only. This facility is in a hydraulically downgradient direction to the Smith property. No other facilities were located within the ASTM search radii.

### **2.3 Physical Setting**

Information with regard to the geology and hydrogeology of the site and surrounding area was obtained from information reasonably ascertainable. A description of the surface water, ground water, and geological characteristics are provided below and provide the basis for opinions rendered specific to the potential for migration of on-site releases of constituents of concern.

<sup>1</sup> Search radii as defined in *ASTM E1527-00, Standard Practice for Environmental Site Assessments: Phase I Environmental Site Assessment Process*.

Tulsa, Oklahoma 74137

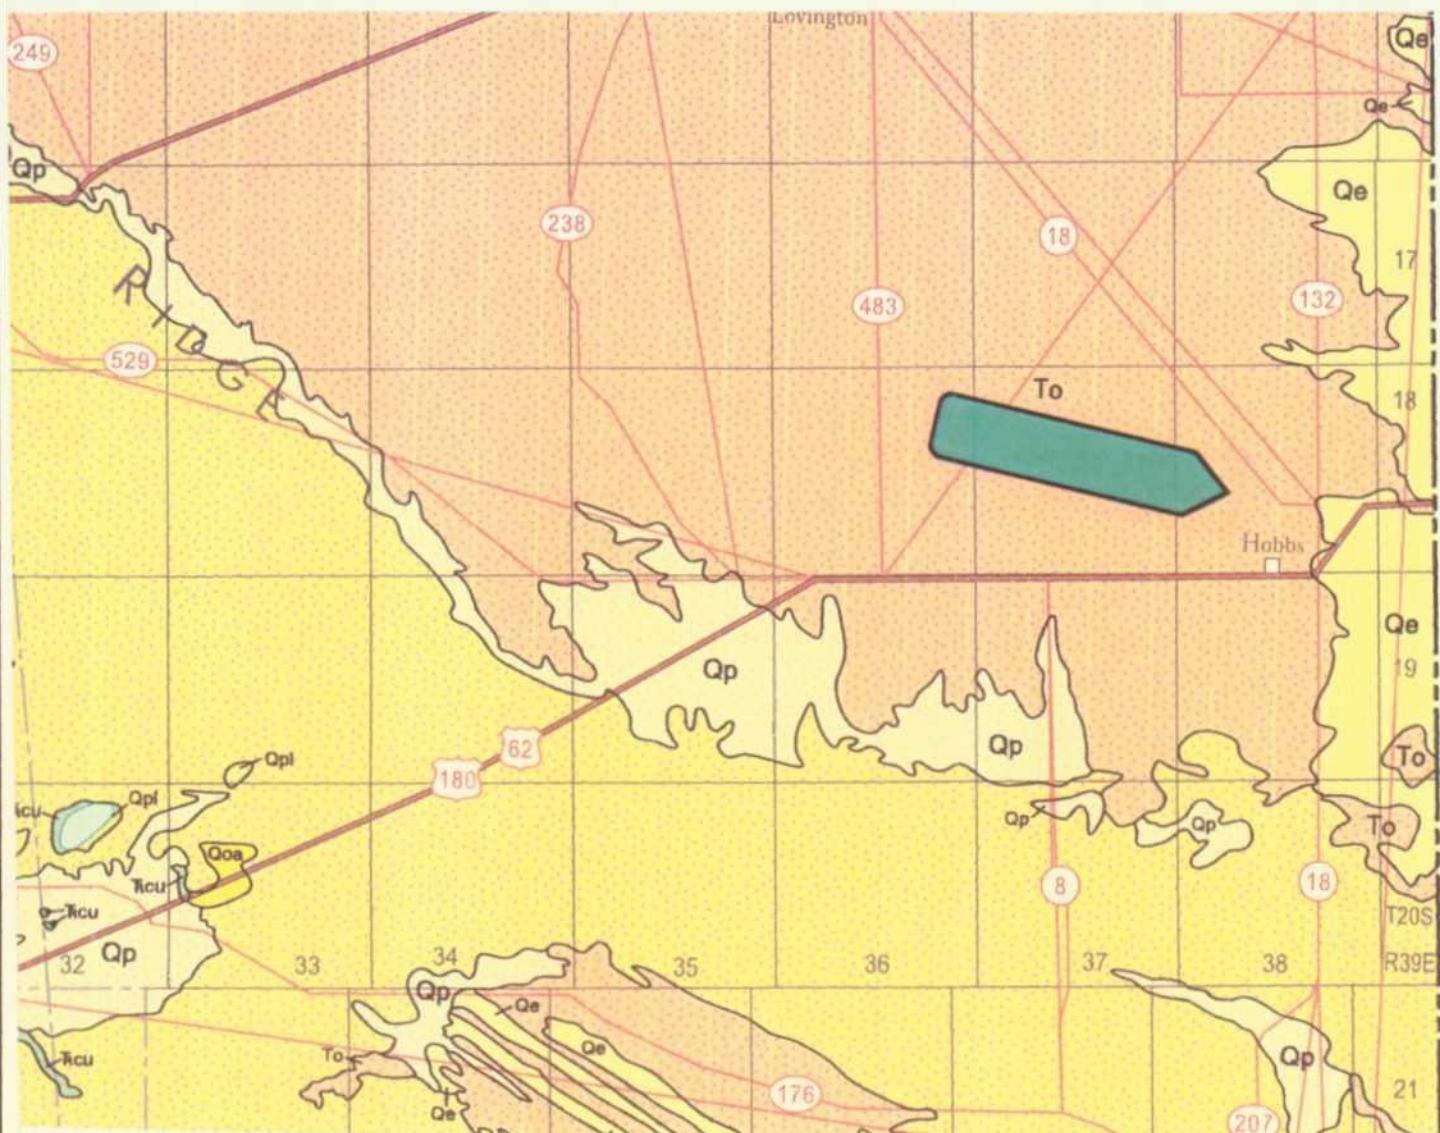

### Topography

The facility is situated within the Great Plains Province and has a topographic elevation of approximately 3,637 feet above National Geodetic Vertical Datum. The site is located near the divide separating flow to either the Seminole Draw or the Monument Draw. A small depression that occasionally retains water exists off-site to the southwest at a distance of 800 feet. Surface run off is generally to the south. Based on information provided by the former facility manager, Mr. Don Gerth, the facility has flooded three times within the last 20 years. The last time was July 2004. When flooding occurs, the standing water covers the entire Smith property and includes adjacent properties.

### Geology

The Drilco property is located on the lower Pliocene to middle Miocene age Ogallala Formation (see Figure 4). The Ogallala Formation consists of alluvial and eolian deposits, and petrocalcic soils of the southern High Plains. Geologic information was obtained from the *Geologic Map of New Mexico*, New Mexico Bureau of Mines and Mineral Resources dated 2003.

The surface soils are described as Portales or Gomez fine sandy loams according to the *Soil Survey of Lea County, New Mexico*, published by the U.S. Department of the Agriculture, Soil Conservation Service. Both soil classifications form within level areas and depressions. Portales loam consists of dark brown to grayish brown loam to a depth of 12 inches. This layer becomes sticky and slightly plastic when wet. The subsoil is pale brown clay loam to a depth of approximately two feet. The next subsoil layer is made up of four feet of pale brown chalky loam with silty soils. Physical properties of the Portales loam are moderately permeable, slow runoff, and moderate water intake.

#### Geologic Legend

- Qp – Quaternary age, Piedmont alluvial deposits
  - Qe – Quaternary age, Eolian deposits
  - Qep – Quaternary age, Eolian and Piedmont deposits
  - To – Tertiary age, Ogallala Formation

**FIGURE 4**  
**HOBBS AREA GEOLOGIC MAP**

**Smith Services, Drilco Facility**  
**1120 West Bender Road**  
**Hobbs, New Mexico**

3-D Project 110403

Gomez fine sandy loam is described as a well-drained soil that has a fine sandy loam subsoil. The surface layer is composed of a 15-inch thick grayish-brown fine sandy loam. The subsoil consists of a seven-inch thick upper layer of light brownish gray fine sandy loam transitioning into a four foot thick second layer comprised of soft caliche having a fine sandy loam texture. This lower layer may be slightly hard and becomes sticky and plastic when wet. Many medium size calcium carbonate concretions are present in this soil zone. Both soil types are mildly to moderately alkaline and become strongly calcareous with depth.

#### Hydrogeology

The regional surface gradient in the area of the Drilco facility is generally to the east.

Locally, the surface gradient is to the south. According to the *Ground Water Atlas of the United States, Segment 2, Arizona, Colorado, New Mexico and Utah*, U.S. Geological Survey, 1995, the facility is underlain by the High Plains Aquifer. The Ogallala Formation is the principle geologic unit of the aquifer in eastern New Mexico and consists of an unconsolidated sequence and poorly sorted sequence of gravel, sand, silt, and clay. A moderate to well cemented zone near the top of the formation is known as the Ogallala cap rock and may be up to 60 feet thick.

Aquifer recharge is primarily from direct precipitation or stream seepage directly on the outcrop surface of the formation in this region. Soil conditions greatly affect aquifer recharge rates. Clayey soils and well cemented soils impede the vertical migration of water. The depth to ground water is generally less than 50 feet. The saturated thickness of the High Plains Aquifer for the Hobbs area is less than 100 feet. Most of the aquifer water is used for agriculture in eastern New Mexico given water quality. The water typically contains dissolved sulfate as the principal anion and is characterized as either a calcium magnesium sulfate or a bicarbonate sulfate type.

An overview of 40 nearby water wells listed in the New Mexico water well database shows an average depth of 55 feet to ground water with a minimum depth of 35 feet as of January 31, 2005. Water well records are presented in Appendix D. An abandoned water well exists on site. According to the former facility manager, Mr. Don Gerth, the facility water supply was changed to city-supplied water in the mid 1990s due to water quality issues of odor.

### Wetlands

A review of the United States Geological Survey (USGS) topographic map of *Hobbs West, New Mexico Quadrangle* (1969, photorevised 1979) did not detect the presence of marsh or marsh-type vegetation at the subject site. It is our opinion that the subject property would not be considered a jurisdictional wetland area at this time.

### Oil and Gas Wells

The facility and the western portions of the city of Hobbs are located within the Hobbs Oil Field. Mr. Don Gerth, the former facility manager, indicated that a P&A oil well exists to the northeast of the office area of the main building. The topographic map (Figure 1) shows the presence of at least one well location on the property, and historic aerial photographs (see following pages) depict a tank battery and reserve pit. Furthermore, the New Mexico Oil and Gas Wells Database (source: <http://octane.nmt.edu/data/>) depicts one plugged and abandoned (P&A) oil well on site (See Appendix E). Additional Phase II assessment is proposed for the areas affected by past oil field activity (Please refer to Section 5.3).

## **2.4 Potential Human and Ecological Receptors**

The Drilco facility is a property developed for industrial use. The facility is fully developed with a fenced perimeter, building structures, gravel surfaced service roads, or gravel surfaced storage yards. The potential human receptor would be an outside industrial worker. No ecological receptors exist within the facility.

The shallow ground water is reportedly to be located at depths greater than 35 feet. The soil to ground-water pathway would be eliminated if the constituents in the impacted soil are shown to be vertically limited and / or do not leach at concentration levels exceeding the maximum contaminant levels (MCLs) for drinking water.

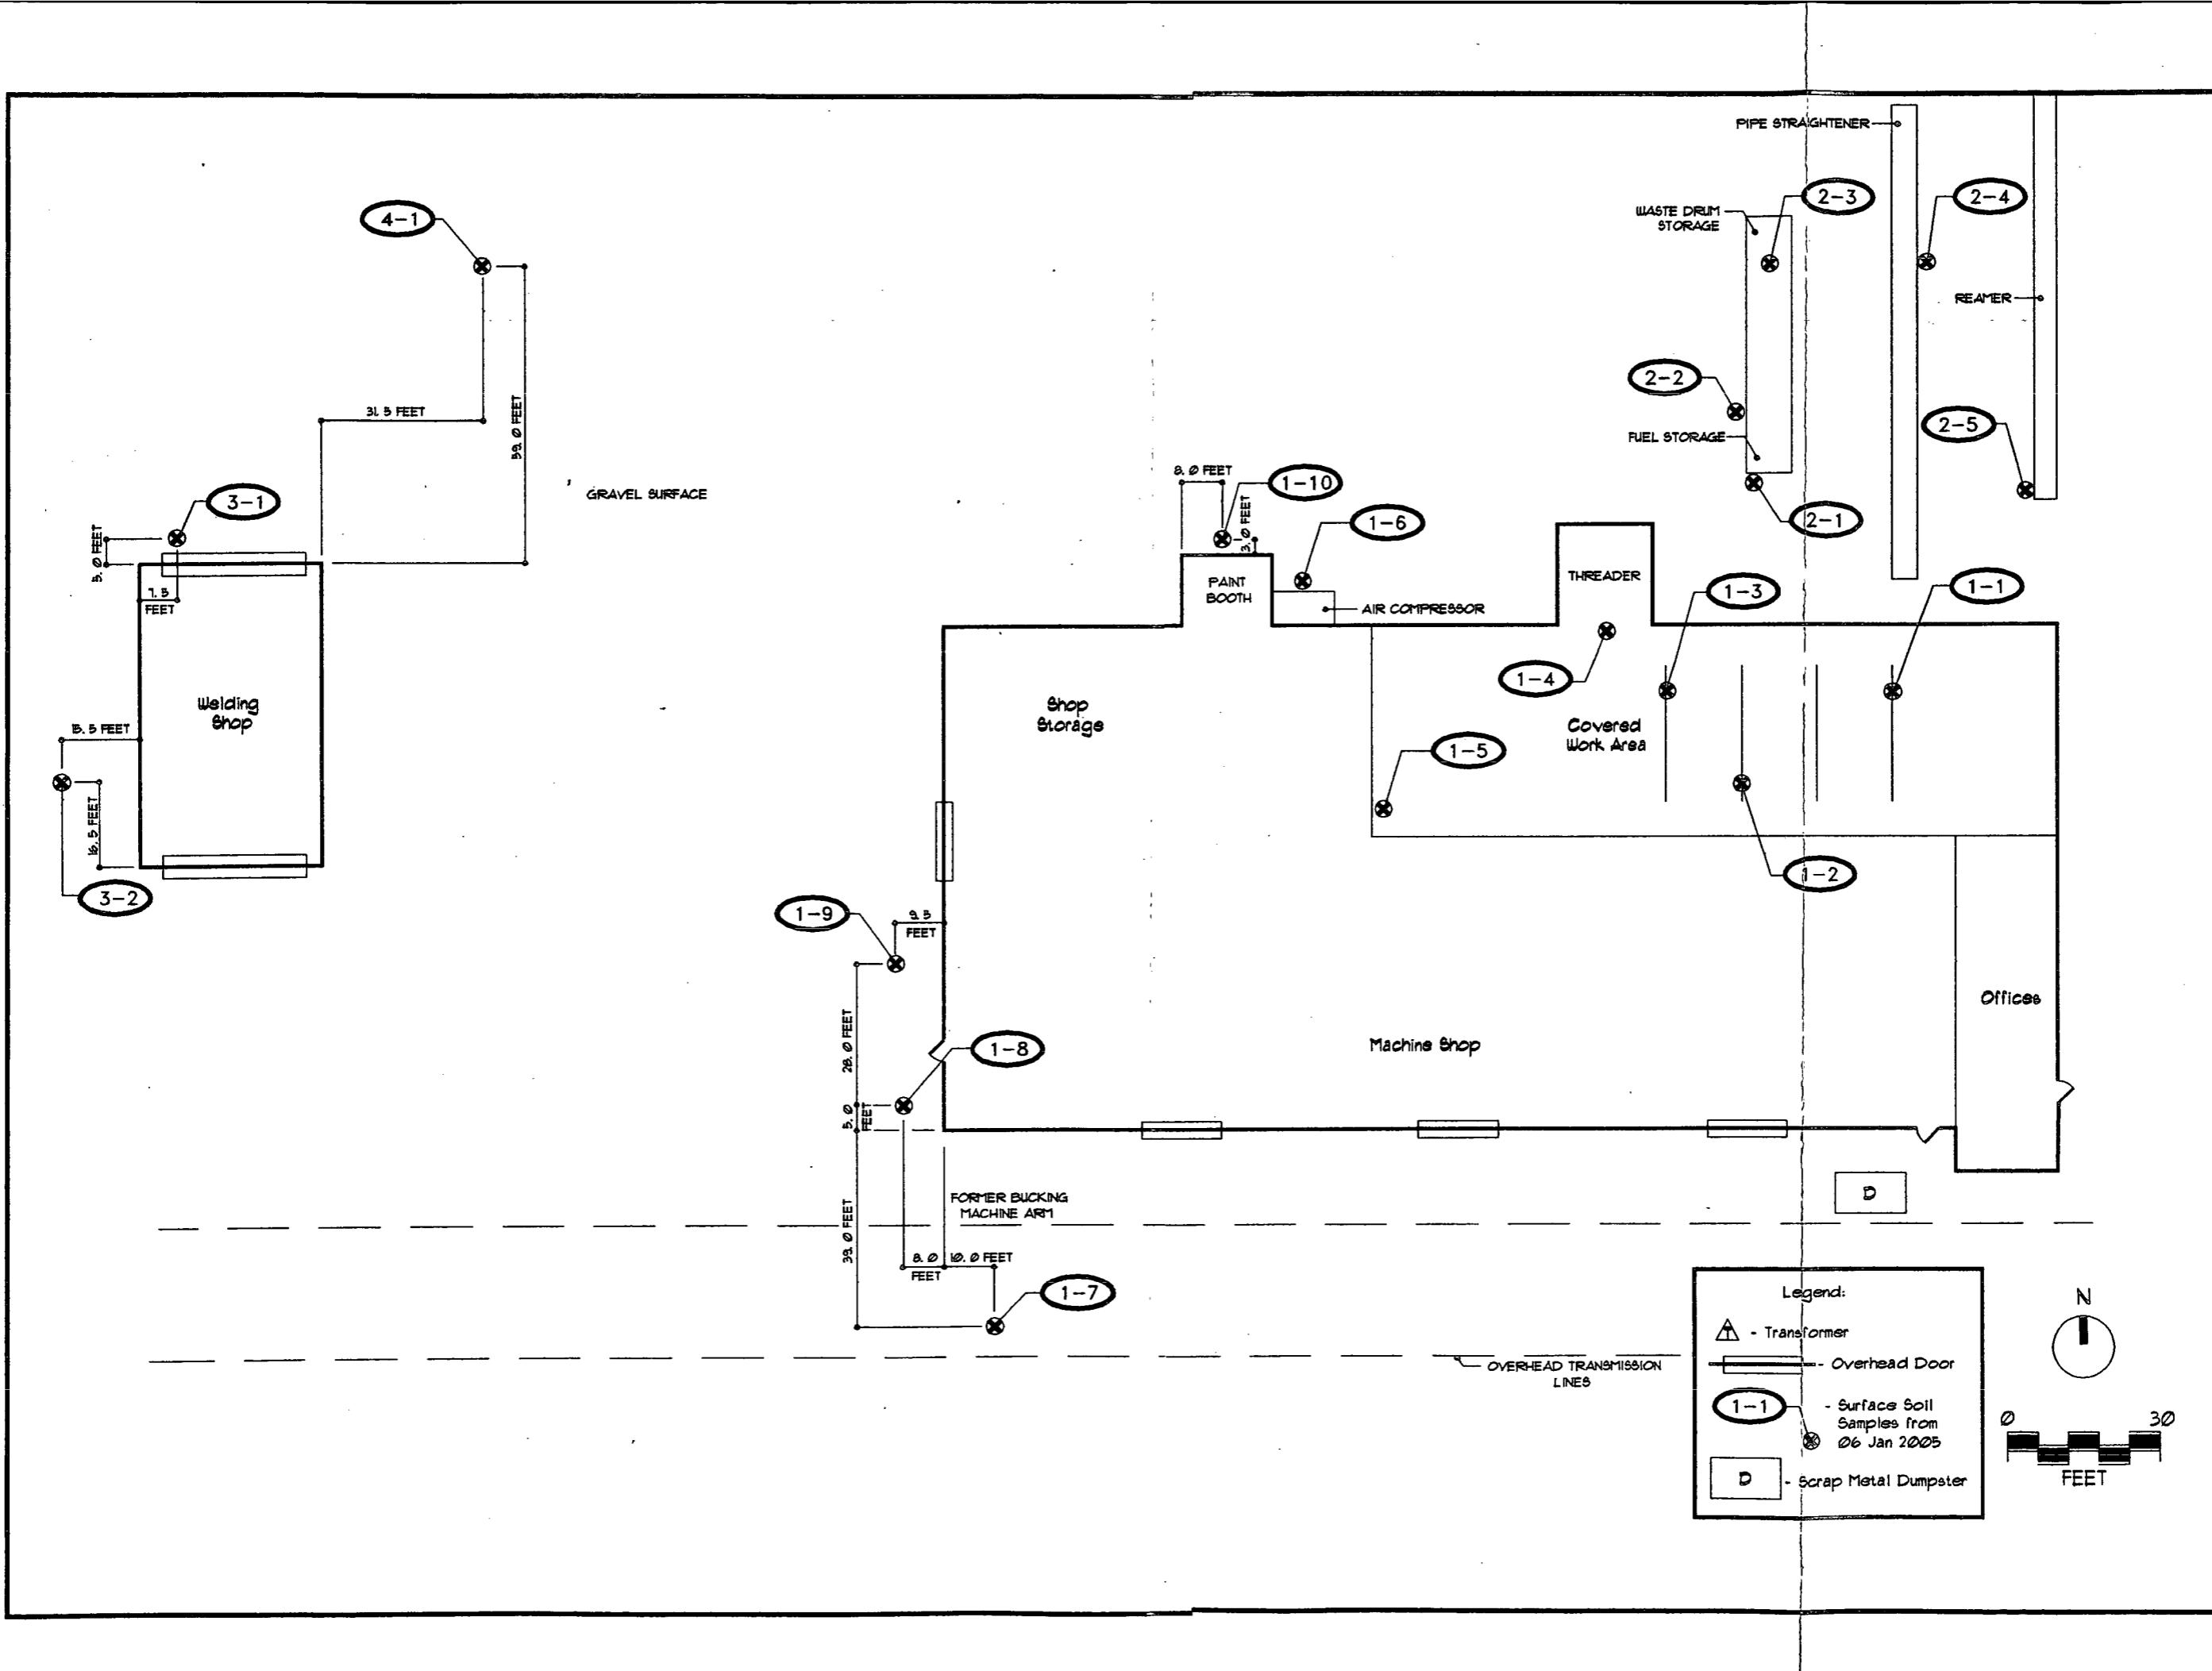

### **3.0 SURFACE SOIL SAMPLING ACTIVITIES**

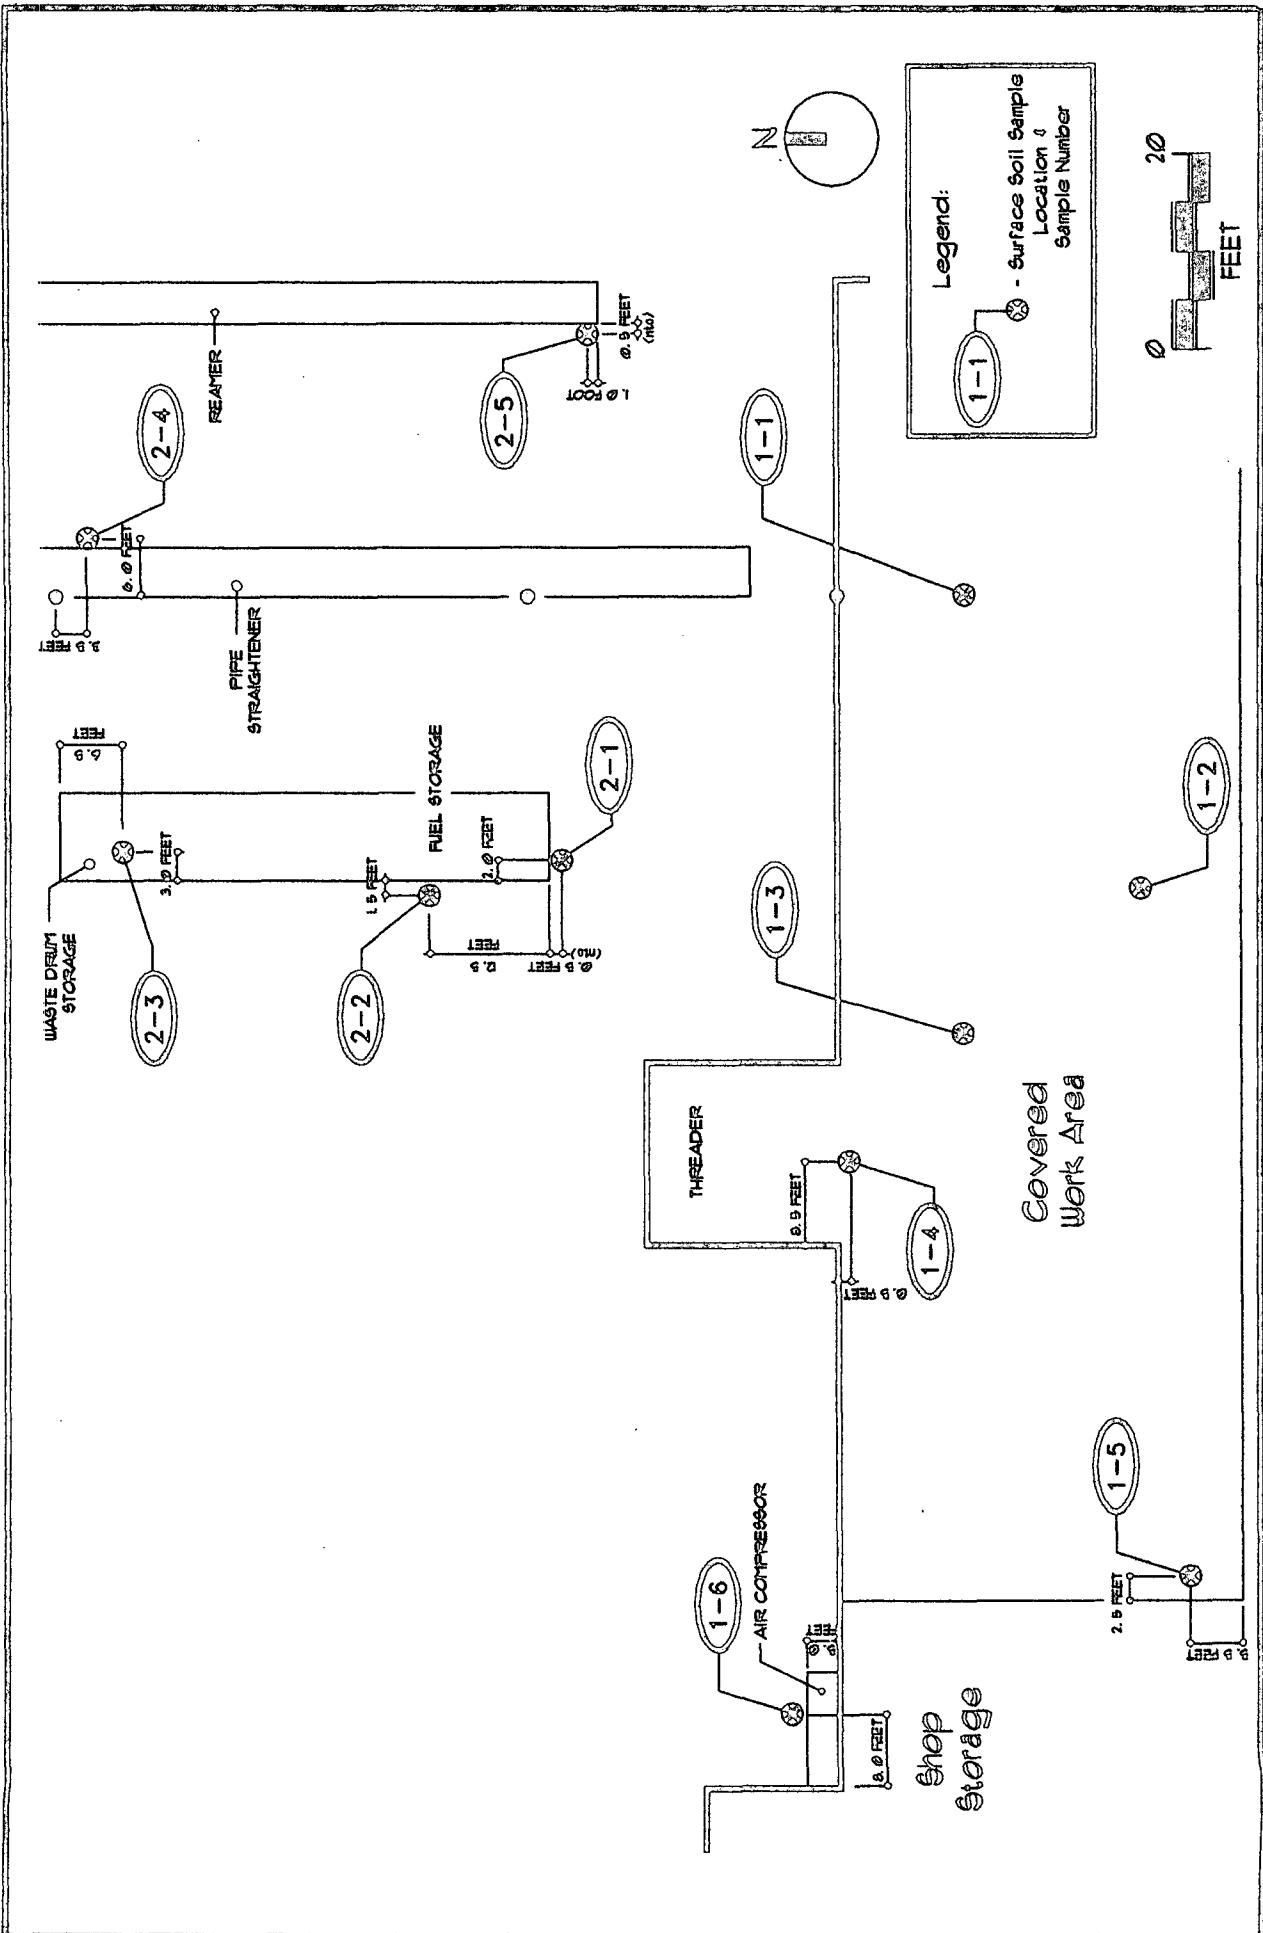

#### **3.1 Soil Sampling Locations**

Locations of potential environmental impact within the facility property were identified during the site reconnaissance in December 2004. The sample locations of the suspect areas are identified in Figures 5 and 6 and are as follows:

##### **Area 1 – Perimeter Areas Surrounding the Machine Shop Building**

1. The exterior work area located to the north of the Machine Shop. Reason: Potential areas of impact may be present within the pipe racks (Samples NM-HB-DRL-1-1 (1-1), 1-2, and 1-3. Oil stained soils were observed to the south of the Threader Shed (Sample 1-4) and in the southwest corner of the work area (Sample 1-5) where previous hydraulically powered equipment was located.
2. The north side of the air compressor foundation pad. Reason: Potential area of impact from air compressor motor leaks (Sample 1-6), although no surficial staining was observed.
3. A former bucking machine and its hydraulic unit were located at the exterior southwest corner of the Machine Shop building. Reason: Oil stained soils were observed (Samples 1-7, 1-8, and 1-9).
4. Beneath the exterior paint vent located to the north of the former paint booth of the Machine Shop. Reason: Possible accumulation of heavy metals and semi-volatile constituents (Sample 1-10).

**FIGURE 6**  
**SOIL SAMPLE PLAN**  
(North of Machine Shop)

3-D

Area 2 – The Fuel and Product Storage Area, the Pipe Straightener Area, and Pipe Reamer Area Located to the North of the Machine Shop

5. The aboveground storage tank (AST) fueling area. Reason: Potential soil impacts may be present around the secondary containment near the drain valve (Sample 2-1) and along the west side near the dispensing hoses (Sample 2-2).
6. The drum storage area. Reason: Possible releases from drums (Sample 2-3).
7. The Pipe Straightener area. Reason: Soil staining was visible on the ground surface where previous hydraulic equipment was located (Sample 2-4).
8. The Pipe Reamer area. Reason: Soil staining was visible on the ground surface where previous hydraulic equipment was located (Sample 2-5).

Area 3 – Perimeter Area Surrounding the Former Machine Shop Building

9. Northwest corner of Machine Shop Building to the west of the overhead door (Sample 3-1). Reason: Potential soil impacts may exist around building doors where wastes could have been stored.
10. West side of Machine Shop Building near west perimeter fence (Sample 3-2). Reason: Potential soil impacts may exist from possible waste storage between the building and fence.

Area 4 – Storage Yard

11. Burn area located in the storage yard (Sample 4-1). Reason: Possible heavy metal or semi-volatile organic contaminants in the surface soils Facility personnel stated that only wood material was burned.

Surface soil sampling was conducted during two separate facility visits and consisted of collecting a total of 11 discrete soil samples on December 1, 2004 and seven discrete soil samples on January 6, 2005.

### 3.2 Soil Sampling Procedures

The surface soil samples were collected using a clean inert polyresin trowel and /or clean plastic syringes and disposable gloves. The sampling equipment was decontaminated between sample points by using a nonphosphate soap wash, distilled water rinse, and air drying. The soil samples were placed in laboratory-supplied jars and were placed in an ice-filled insulated cooler. At the completion of field soil sampling, the samples were conveyed by overnight package service using standard chain-of-custody procedures to DHL Analytical of Round Rock, Texas.

The requested laboratory analytical methods were one or more of the following:

- Semi-volatile Organic Compounds (SVOCs) using EPA Method SW8270C.
- Volatile Organic Compounds (VOCs) using EPA Methods 5035 and SW8260B.
- RCRA metals (Barium, Chromium, Cadmium, Lead, Mercury, Silver, Arsenic, Selenium) using EPA Method SW6020 and EPA Method SW7471A (for Mercury).
- Total Petroleum Hydrocarbons (TPH) using M8015GRO and M8015DRO.

The soil sample chain-of-custodies are provided in Appendices A and B and show the requested analyses for each soil sample that was submitted to the analytical laboratory.

Additional Synthetic Precipitation Leaching Procedure (SPLP) analysis using EPA Method SW1312 / 6020 was performed on select soil samples for metal constituents after the initial results were received. The purpose of the SPLP analysis was to establish a site-specific Soil to Ground Water soil screening level (SSL) for select metal constituents.

## 4.0 LABORATORY ANALYTICAL FINDINGS

A summary of the analytical results is provided in Tables 1 and 2 on pages 11 through 18. The laboratory data sheets are provided in Appendices A and B.

<sup>2</sup> DAF, Dilution Attenuation Factor is the ratio of the contaminant concentration in soil leachate to the concentration in ground water at the point of withdrawal.

NPT - SSL values were not provided in tables<sup>1</sup>.

Bold values exceed the residential and / or industrial SSLs.

#### 4.1 Soil Sample Analysis Summary

The laboratory analysis of the soil samples collected on December 1, 2004 and January 6, 2005 are summarized below. The concentration of the metal element Arsenic exceeded the regional background concentration of 4.1 mg/kg in every sample. The residential direct contact SSL for arsenic is 3.9 mg/kg or the background concentration whichever is greater. The summary comments incorporate the SPLP metal results (Section 4.2) that are described in detail after this section:

#### Area 1 – Perimeters Areas Surrounding the Machine Shop Building

| Sample Number / Exceeds SSL Standard    | 1-1 | 1-2 | 1-3 | 1-4 | 1-5 | 1-6 | 1-7 | 1-8 | 1-9 | 1-10 |
|---|-----|-----|-----|-----|-----|-----|-----|-----|-----|------|
| Soil to GW                              | X   | --  | --  | P   | P   | --  | P   | --  | --  | --   |
| Residential Direct Contact <sup>1</sup> | X   | X   | -   | X   | X   | --  | X   | X   | X   | --   |
| Industrial Direct Contact               | X   | X   | -   | X   | X   | --  | X   | --  | --  | --   |

Note: <sup>1</sup> Does not include Arsenic for Residential Direct Contact.

P – Probable for TPH constituents.

- Sample 1-1 contained SVOCs, TPH, and metal elements above background concentrations. Lead SPLP testing on the soil sample produced an extract containing 42.0 micrograms per liter (ug/L) which is greater than the Ground Water SSL of 15 ug/L. Arsenic and Lead constituents exceed the critical industrial SSLs for Direct Contact.
- Sample 1-2 held elevated levels of SVOCs, TPH, and metal elements above background concentrations. Lead constituents exceeded the critical industrial SSL for Direct Contact. One SVOC compound, Benzo[a]pyrene exceeded the residential SSL for Direct Contact.
- Sample 1-3 had SVOC and metal constituents above background levels but less than critical residential and industrial SSLs.
- Sample 1-4 contained SVOC and metal elements above background concentration levels or the laboratory analytical MDL. TPH constituents exceed the critical industrial SSL for Direct Contact.

- Sample 1-5 had high levels of TPH constituents exceeding the critical industrial SSL (Direct Contact). Low concentrations of SVOC compounds were also detected below residential SSLs.
- Sample 1-6 held low level metal elements above background levels. None of the constituents exceeded the critical SSLs in either setting.
- Sample 1-7 had high levels of TPH constituents exceeding the critical industrial SSL (Direct Contact).
- Samples 1-8, 1-9, and 1-10 contained TPH and metal elements above background concentrations. None of the constituents exceeded the critical SSLs in an industrial setting. Residential SSLs were exceeded for TPH compounds in samples 1-8 and 1-9.

Area 2 – The Fuel and Product Storage Area, the Pipe Straightener Area, and Pipe Reamer Area Located to the North of the Machine Shop

| Sample Number / Exceeds SSL Standard    | 2-1 | 2-2 | 2-3 | 2-4 | 2-5 |
|---|-----|-----|-----|-----|-----|
| Soil to GW                              | --  | --  | X   | P   | P   |
| Residential Direct Contact <sup>1</sup> | --  | X   | --  | X   | X   |
| Industrial Direct Contact               | --  | X   | --  | X   | X   |

Note: <sup>1</sup> Does not include Arsenic for Residential Direct Contact.

P – Probable for TPH constituents.

- Samples 2-1, 2-2, and 2-3 contained VOC, SVOC, and/or metal constituents above background concentrations. TPH compounds were also detected in Samples 2-2 and 2-3. All constituents are less than critical SSLs in both residential and industrial settings with the exception of Arsenic in Sample 2-2 for Industrial Direct Contact exposure. The VOC compound, Tetrachloroethene, was present in Sample 2-3 and exceeded the soil to ground water pathway SSL.
- Samples 2-4 and 2-5 contained VOC, SVOC, and/or metal constituents above background concentrations and elevated levels of TPH compounds. TPH constituents exceeded the critical Industrial SSL for Direct Contact.

### Area 3 – Perimeter Area Surrounding the Former Machine Shop Building

| Sample Number / Exceeds SSL Standard    | 3-1 | 3-2 |
|---|-----|-----|
| Soil to GW                              | --  | --  |
| Residential Direct Contact <sup>1</sup> | --  | --  |
| Industrial Direct Contact               | --  | --  |

Note: <sup>1</sup> Does not include Arsenic for Residential Direct Contact.

Samples 3-1 and 3-2 contained low levels of TPH and metal constituents above background levels but less than critical residential and industrial SSLs. Sample 3-1 contained a single SVOC constituent, Di-n-octyl phthalate.

### Area 4 – Storage Yard

| Sample Number / Exceeds SSL Standard    | 4-1 |
|---|-----|
| Soil to GW                              | --  |
| Residential Direct Contact <sup>1</sup> | --  |
| Industrial Direct Contact               | --  |

Note: <sup>1</sup> Does not include Arsenic for Residential Direct Contact.

Sample 4-1 contained metal constituents above background levels but less than critical residential and industrial SSLs.

## **4.2 SPLP Leachate Analytical Findings**

SPLP testing was performed on five soil samples (1-1, 1-2, 1-3, 1-6, and 1-7) with the purpose of establishing a site-specific Soil to Ground Water SSL for select metal constituents. Table 3 presents the analytical results of the total metal concentrations and the SPLP concentrations and compares these results with the critical Ground Water SSLs.

**TABLE 3**  
**SPLP LABORATORY ANALYTICAL RESULTS**  
**SMITH SERVICES, DRILCO – HOBBS FACILITY**  
**Samples Collected on December 1, 2004 and January 6, 2005**  
(SPLP soil concentrations values are expressed in micrograms per liter, ug/L. Total metal concentrations are stated in milligrams per kilogram, mg/kg)

Note: A "--" means that analysis was not requested or that the Ground Water SSL values are not applicable.

<sup>1</sup> Sample was prepared outside of the Hold Time.

On the basis of the SPLP analytical findings presented, soil sample 1-1 produced a Lead leachate (42.0 ug/L) that exceeded the critical ground water SSL of 15 ug/L. The other SPLP tests provide a site-specific baseline for establishing a Soil to Ground Water SSL where no impact will occur that exceeds the critical ground water SSL.

The site-specific soil to ground water SSLs for the various metals are as follows:

- Mercury: > 0.132 mg/kg
- Barium: > 3,190 mg/kg
- Chromium: > 735 mg/kg
- Lead: > 881 mg/kg

## 5.0 SITE REMEDIATION WORK PLAN

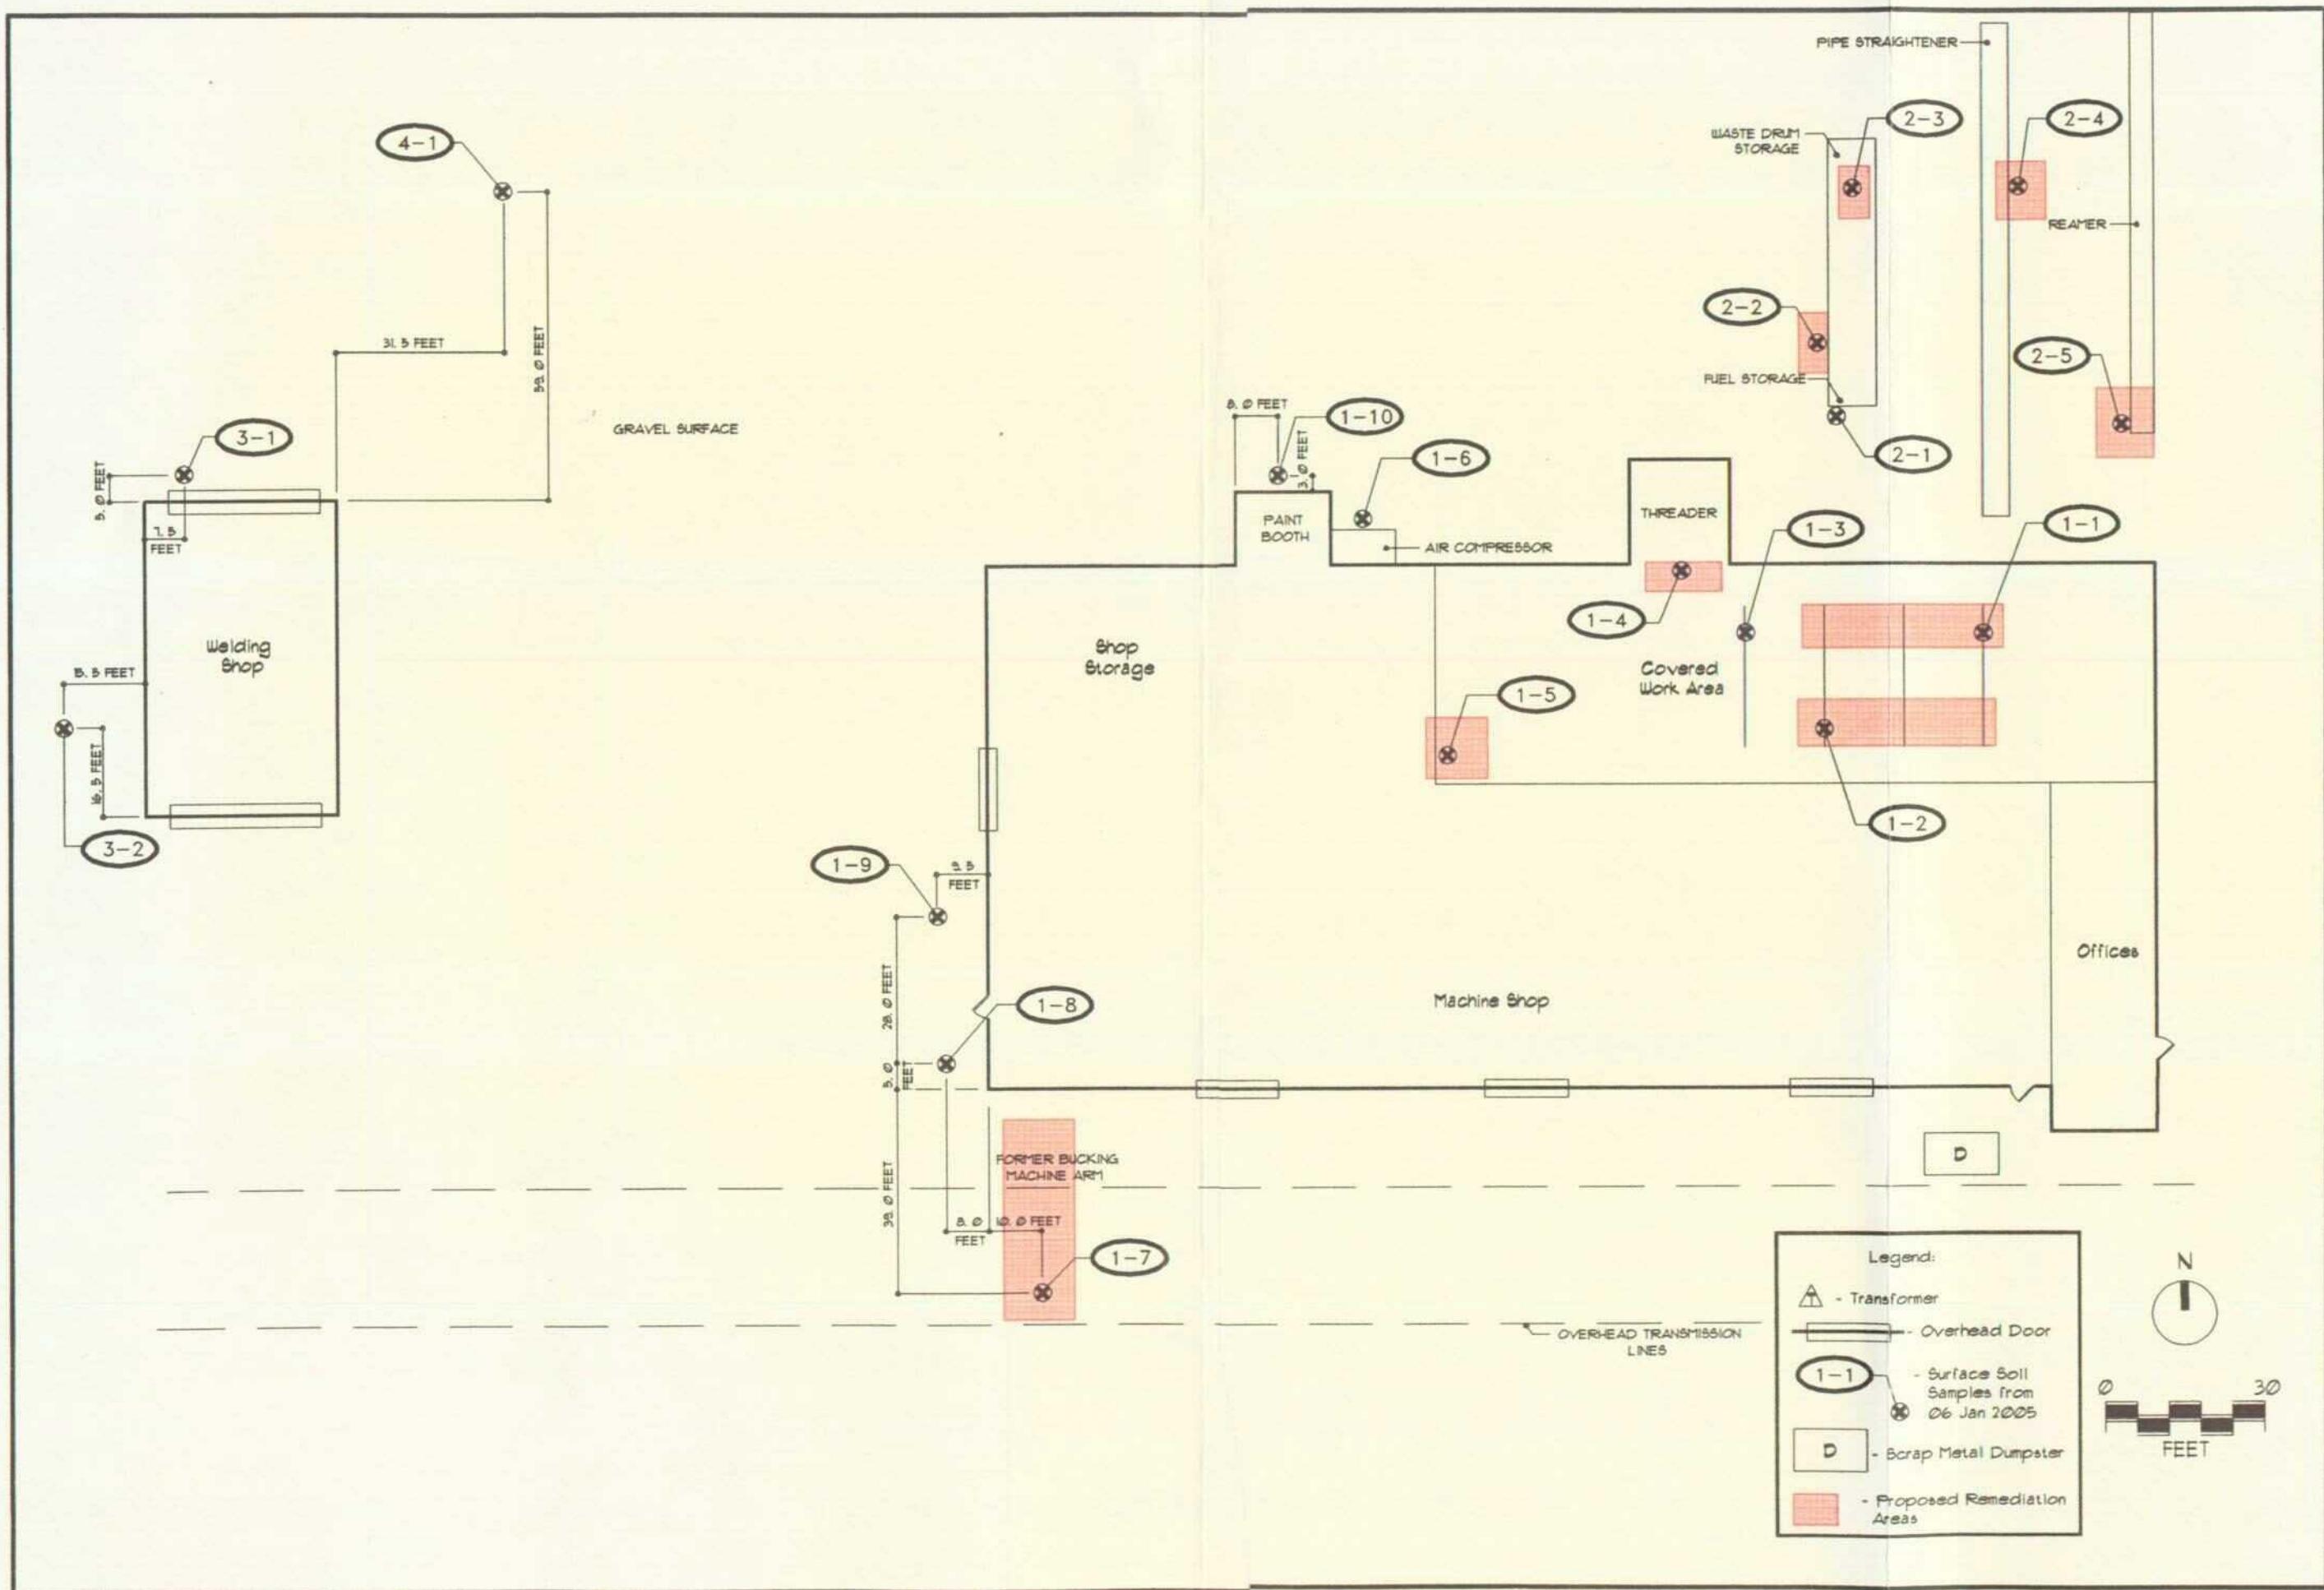

The Phase II ESA documented the presence of certain metal, TPH, VOC, and SVOC constituents (refer to Tables 1 and 2 and descriptions provided in Section 4.1). Some of the chemicals of concern (COCs) exceeded critical SSL standards in an industrial setting. The following work plan is proposed to address the assessment findings (refer to Figure 6):

### 5.1 Proposed Soil Excavation Remediation

The identified affected on-site locations having soil impacts that exceeded the critical industrial SSL are:

#### Area 1 – Perimeters Areas Surrounding the Machine Shop Building

1. Certain areas along the former pipe rack rails located in the work area to the north of the machine shop (Samples 1-1 and 1-2) contained elevated Arsenic and/or Lead exceeding the critical Industrial SSL for Direct Contact. Soil remediation by excavation is proposed to reduce the COC(s) to less than the critical SSL(s).
2. The surface soil (Sample 1-4) located at the south end of the Threader shed had impacted TPH compounds exceeding the critical Industrial SSL for Direct Contact. Soil remediation by excavation is proposed to reduce the COC(s) to less than the critical SSL(s).
3. The surface soil (Sample 1-5) located in the southwest corner of the work area was affected by historic spills or leaks from hydraulic hoses. The soil contains TPH COCs exceeding the critical Industrial SSL for Direct Contact. Soil remediation by excavation is proposed to reduce the COCs to less than the critical SSLs.

**FIGURE 7  
PROPOSED SITE REMEDIATION PLAN**

Smith Services, Drilco Facility  
1120 W. Bender Road  
Hobbs, New Mexico  
3-D Project : 110403

3-D

4. The surface soil located to the south of the southwest corner of the machine shop where the former Bucking Machine stood was impacted by hydraulic oil spills and leaks. The soil contains TPH COCs exceeding the critical Industrial SSL for Direct Contact. Soil remediation by excavation is proposed to reduce the COCs to less than the critical SSLs.

Area 2 – The Fuel and Product Storage Area, the Pipe Straightener Area, and Pipe Reamer Area Located to the North of the Machine Shop

5. Elevated Arsenic constituents were detected in Sample 2-2 exceeding Industrial Direct Contact exposure. Soil remediation by excavation is proposed to reduce the Arsenic COC to less than the critical SSL.
6. One VOC constituent, Tetrachloroethene was detected in Sample 2-3. Vertical delineation at this sample point is proposed to show the presence or absence of the COC at depth.
7. TPH compounds were found in surface soil samples 2-4 (pipe straightener) and 2-5 (pipe reamer) exceeding Industrial Direct Contact exposure. Soil remediation by excavation is proposed at both of these locations to reduce the TPH COCs to less than the critical SSL.

The proposed excavation work would typically consist of removing native soil, at each of the sample points identified above, a minimum of eight feet in each horizontal direction and to a depth of two feet. Four sidewalls and one floor soil sample will be collected and submitted for analysis of the appropriate contaminant constituents. Sidewall samples will be collected from the upper twelve inches of native soil.

One composite soil sample will be taken from each soil stockpile generated by the soil remediation activities. The composite soil sample will be analyzed for constituents or other physical parameters required by the disposal facility.

## **5.2 Arsenic Background Soil Sampling**

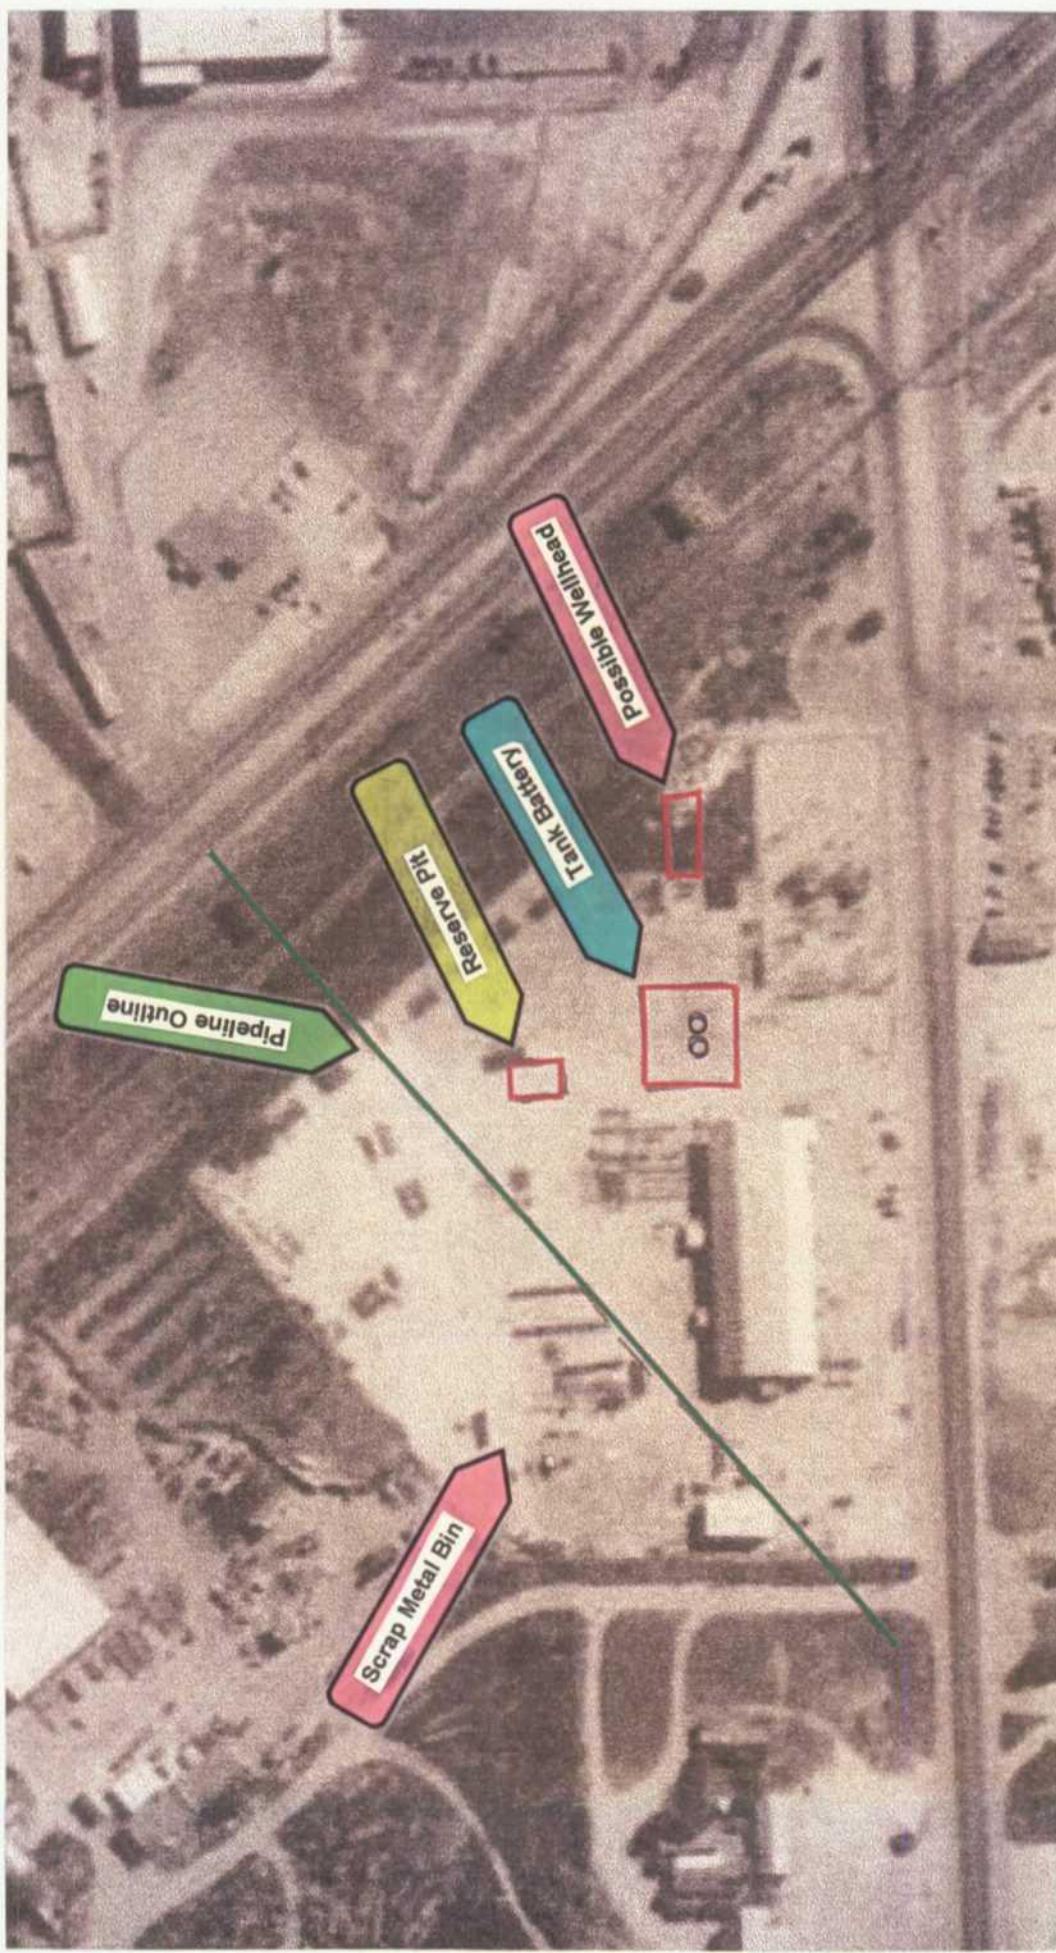

Eight surface soil samples will be collected in relatively unaffected areas of the storage yard. The soil samples will be submitted to the analytical laboratory for total Arsenic analysis. Following the receipt of the analysis from the laboratory, a site-specific Arsenic background concentration and upper tolerance limit will be calculated and compared against previous analytical findings.

## **5.3 Proposed Continued Phase II Assessment Activities**

Historic information acquired from aerial photographs and an interview with the former facility manager revealed up to four additional areas for assessment. These locations are as follows (see Figure 8):

1. Former Oil Wellhead.
2. Former Tank Battery
3. Former Reserve Pit
4. Former Scrap Metal Bin

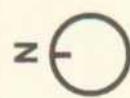

A description of the field assessment procedures are provided in Appendix C. The laboratory analytical testing procedures for both the site remediation and continued Phase II assessment will be the same procedures used during the Phase II ESA.

## **PHOTOGRAPHS**

**Photograph 1:** Three surface soil samples were collected within the Covered Work Area located to the north of the Machine Shop.

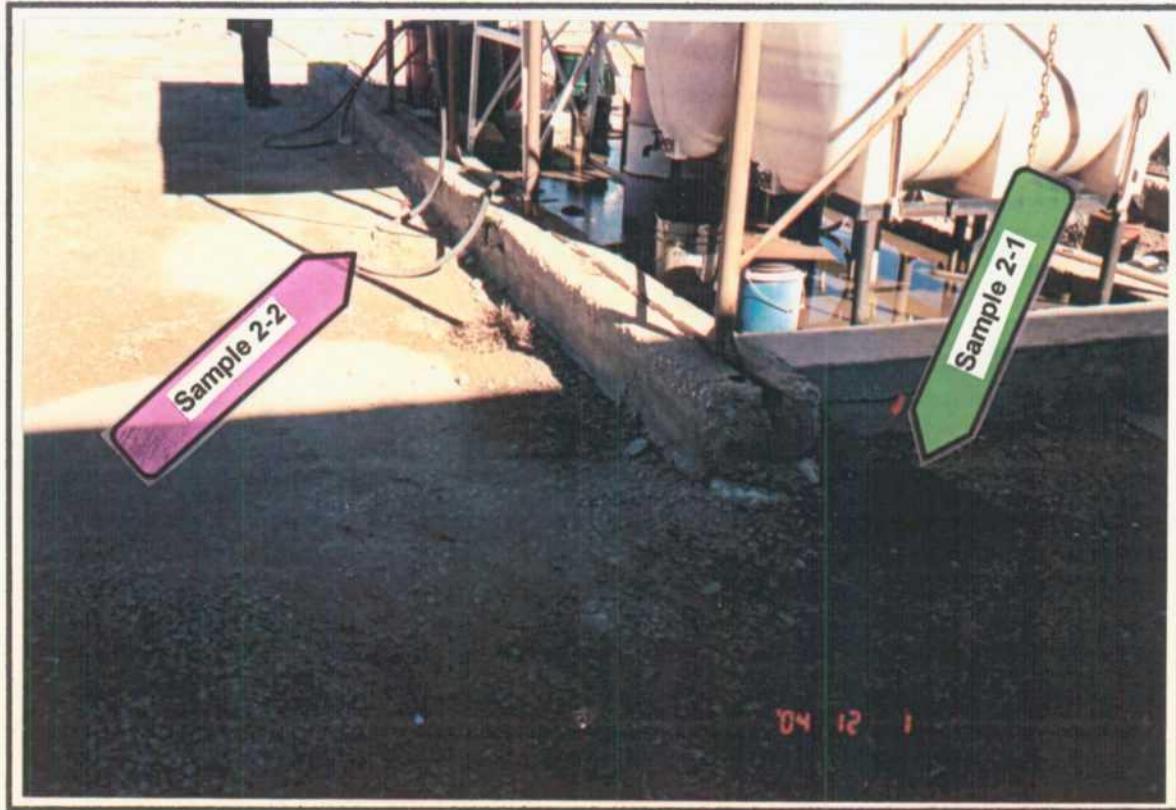

**Photograph 2:** Soil sample NM-HB-DRL-1-4 (1-4) was taken within a soil stained area to the south of the Threader Shed.

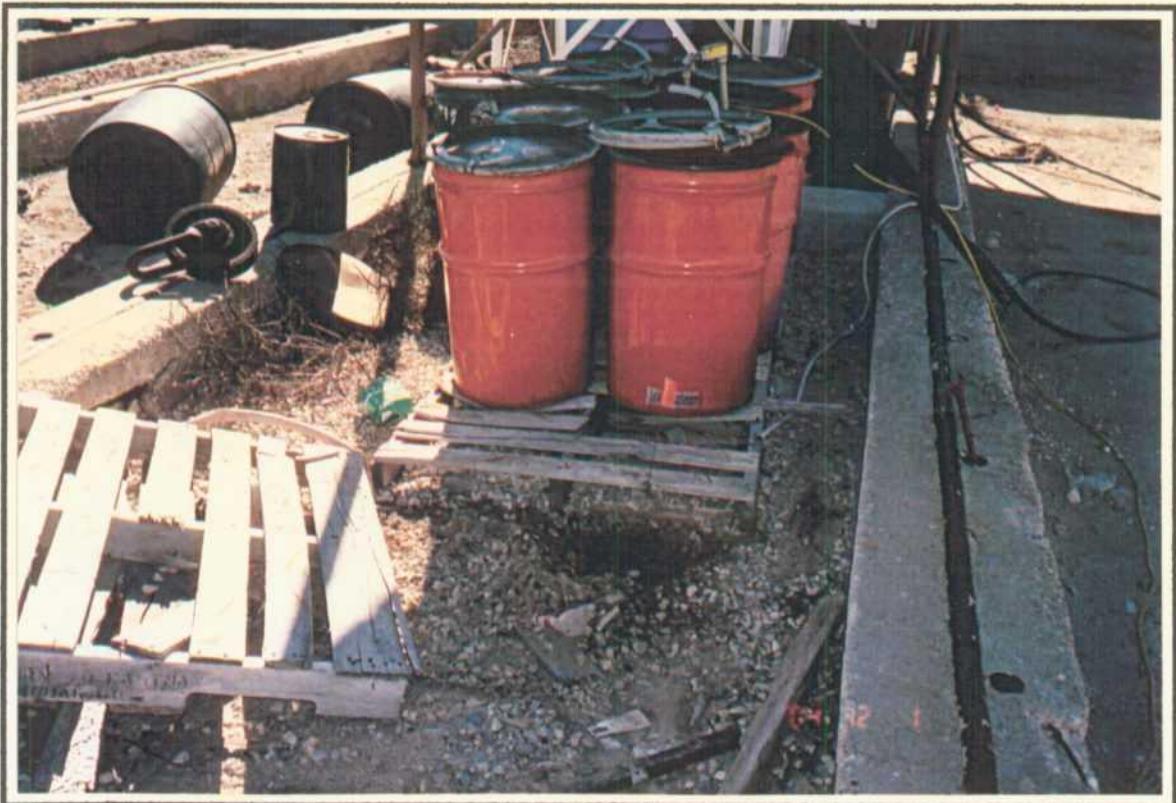

Photograph 3: Sample 1-5 was located in the southwest corner of the Covered Work Area.

Photograph 4: Soil sample 1-6 was taken at the base of the air compressor concrete located along the north exterior wall of the Machine Shop.

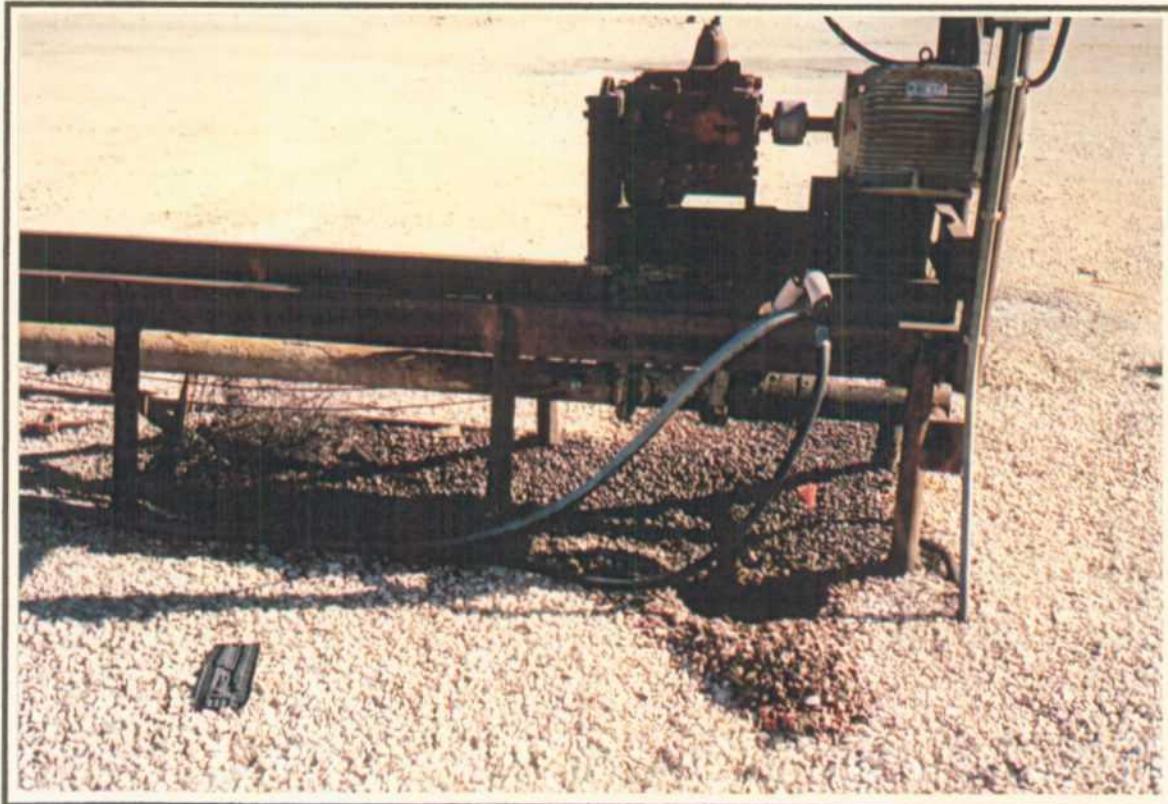

**Photograph 5:** Two samples were collected around the containment perimeter of the product storage area.

**Photograph 6:** Sample 2-3 was collected in the product drum storage area.

**Photograph 7:** Soil sample 2-4 was taken within the stained area adjacent to the pipe straightener.

**Photograph 8:** The soil at the south end of the pipe reamer was oil stained (Sample 2-5).

**Photograph 9:** The ground surface beneath the former Bucking Machine area was hydrocarbon stained (Sample 1-7).

**Photograph 10:** Additional stained soil was identified to the west of the Machine Shop near the Bucking Machine area (Sample 1-8).

**Photograph 11:** Sample 1-9 was collected between the west overhead door of the Machine Shop and a mandoor.

**Photograph 12:** Sample 1-10 was taken beneath the paint vent located along the north exterior wall of the Machine Shop.

**Photograph 13:** The former Welding Shop was located near the west perimeter fence.

**Photograph 14:** Soil sample 3-1 was taken to the northwest of the north overhead door of the Welding Shop.

**Photograph 15:** Soil sample 2-2 was collected to the west of the Welding Shop near the west perimeter fence.

**Photograph 16:** A former burn area within the storage yard was located to the northeast of the Welding Shop (Sample 4-1).

RE: Sii Smith Services Hobbs NM

Order No.: 0412014

Dear Lee Davis/Kurt Lampi:

DHL Analytical received 11 samples on 12/2/2004 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

John DuPont  
General Manager

**Qualifiers:** ND - Not Detected at the Method Detection Limit  
J - Analyte detected between MDL and RL  
B - Analyte detected in the associated Method Blank

S - Spike Recovery outside control limits  
C - Sample Result or QC discussed in Case Narrative  
E - TPH pattern not Gas or Diesel Range Pattern

**Qualifiers:** ND - Not Detected at the Method Detection Limit  
J - Analyte detected between MDL and RL  
B - Analyte detected in the associated Method Blank

S - Spike Recovery outside control limits  
C - Sample Result or QC discussed in Case Narrative  
E - TPH pattern not Gas or Diesel Range Pattern

**Qualifiers:** ND - Not Detected at the Method Detection Limit

S - Spike Recovery outside control limits

J - Analyte detected between MDL and RL

C - Sample Result or QC discussed in Case Narrative

B - Analyte detected in the associated Method Blank

E - TPH pattern not Gas or Diesel Range Pattern

**Qualifiers:** ND - Not Detected at the Method Detection Limit

S - Spike Recovery outside control limits

J - Analyte detected between MDL and RL

C - Sample Result or QC discussed in Case Narrative

B - Analyte detected in the associated Method Blank

E - TPH pattern not Gas or Diesel Range Pattern

**Qualifiers:** ND - Not Detected at the Method Detection Limit

S - Spike Recovery outside control limits

J - Analyte detected between MDL and RL

C - Sample Result or QC discussed in Case Narrative

B - Analyte detected in the associated Method Blank

E - TPH pattern not Gas or Diesel Range Pattern

**Qualifiers:** ND - Not Detected at the Method Detection Limit  
J - Analyte detected between MDL and RL  
B - Analyte detected in the associated Method Blank

S - Spike Recovery outside control limits  
C - Sample Result or QC discussed in Case Narrative  
E - TPH pattern not Gas or Diesel Range Pattern

**CASE NARRATIVE**

TestMethodsforEvaluatingSolidWaste,Physical/ChemicalMethods,SW846,3rdEdition.

MethodSW8260B-VolatileOrganics  
MethodSW8270C-SemivolatileOrganics  
Method SW6020-Metals Analysis  
Method SW7471A-Mercury Analysis  
Method M8015D - DRO/ORO Analysis  
MethodM8015V-Gasoline Range Organics  
MethodD2216-PercentMoisture

**LOG IN**

Samples were received and log-in performed on 12/2/04. A total of 11 samples were received. Sample NM-HB-DRL-2-4 had 1 VOA vial broken in the laboratory.

**DRO/ORO**

ForDRO/ORO analysis performed on 12/6/04 the surrogate recoveries for a few QC samples were below control limits for Octacosane. These are flagged accordingly in the QC summary report. No further corrective actions were required and no sample results were adversely affected.

**GASOLINE RANGE ORGANICS**

ForGRO analysis performed on 12/6/04 the surrogate recoveries for samples NM-HB-DRL-2-4 and NM-HB-DRL-2-5 were below control limits. The samples were re-analyzed which confirmed matrix interference.

**METALS**

ForMetals analysis performed on 12/6/04 the matrix spike and matrix spiked duplicate recoveries were below control limits for Barium and/or Lead. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these analytes. No further corrective actions were required and no sample results were adversely affected.

**SEMOVOLATILES**

ForSemivolatilesanalysis performed on 12/8/04 Benzo[g,h,I]perylene was detected below the reporting limit in the method blank. All samples that are not below detection limits may be biased high.

**CLIENT:** SMITH INTERNATIONAL  
**Project:** Sii Smith Services Hobbs NM  
**LabOrder:** 0412014

## CASE NARRATIVE

For Semivolatiles analysis performed on 12/8/04 and 12/10/04 a few samples were diluted prior to analysis due to the nature of the samples.

For Semivolatiles analysis performed on 12/8/04 the LCS recovery was slightly above control limits for Acenaphthylene and Hexachlorocyclopentadiene. These are flagged accordingly in the QC summary report. No further corrective actions were required and no sample results were adversely affected.

For Semivolatiles analysis performed on 12/8/04 and 12/9/04 the ICVs were slightly below control limits for Pentachlorophenol. These are flagged accordingly. No further corrective actions were required and no sample results were adversely affected.

For Semivolatiles analysis performed on 12/8/04 and 12/9/04 the surrogate recoveries for some samples and some QC samples were above control limits for 2,4,6-Tribromophenol and/or 4-Terphenyl-d14. These are flagged accordingly. No further corrective actions were required and no sample results were adversely affected.

## VOLATILES

For Volatiles analysis performed on 12/3/04 samples NM-HB-DRL-1-4 and NM-HB-DRL-1-5 had some target analytes reported from the re-analysis on 12/6/04 due to the low internal response for 1,4-Dichlorobenzene-d4.

For Volatiles analysis performed on 12/6/04 the matrix spike and matrix spiked duplicate recoveries were below control limits for Chlorobenzene and Toluene. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these compounds. No further corrective actions were required and no sample results were adversely affected.

For Volatiles analysis performed on 12/3/04 the LCS recovery was slightly above control limits for Chloroethane and Trichlorofluoromethane. No further corrective actions were required and no sample results were adversely affected.

For Volatiles analysis performed on 12/3/04 and 12/6/04 the ICVs were slightly above control limits for Trichlorofluoromethane. No further corrective actions were required and no sample results were adversely affected.

**LabOrder:** 0412014

## CASE NARRATIVE

### DATA REPORTING

Sample reports include the Method Detection Limit (MDL) and the Reporting Limit (RL) for each analyte. The computer system allows for reporting MDL with 2 significant figures and the RL with 3 significant figures. Because of rounding it may sometimes appear that a "J" flagged result is lower than the MDL if the sample result is very near the MDL.

**Qualifiers:** ND - Not Detected at the Method Detection Limit

R - RPD outside accepted recovery limits

J - Analyte detected below quantitation limits

B - Analyte detected in the associated Method Blank

S - Spike Recovery outside accepted recovery limits

RE: Sii Smith Services Drilco Hobbs NM

Order No.: 0501104

Dear Lee Davis/Kurt Lampi:

DHL Analytical received 5 samples on 1/20/2005 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten signature in black ink, appearing to read "John DuPont".

John DuPont  
General Manager

## TABLE OF CONTENTS

This report for SMITH INTERNATIONAL: Sii Smith Services Drilco Hobbs NM (DHL Work Order 0501104) contains the following information:

| ITEM  | Page  |
|---|-------|
| • Cover Page  | 1     |
| • Table of Contents   | 2     |
| • Original chain of custody, fedex slip (if used), log-in checklist | 3-5   |
| • Case Narrative  | 6     |
| • Work Order Sample Summary   | 7     |
| • Preparation Dates Report  | 8     |
| • TCLP/SPLP Prep Dates Report                                       | 9     |
| • Analytical Dates Report   | 10    |
| • Sample Results  | 11-15 |
| • QC Summary Report   | 16-20 |
| • Total Number of Pages   | 20    |

January 27, 2005

Approved:

A handwritten signature in black ink, appearing to read "John DuPont". The signature is fluid and cursive, with some loops and variations in line thickness.

**CLIENT:** SMITH INTERNATIONAL  
**Project:** Sii Smith Services Drilco Hobbs NM  
**Lab Order:** 0501104

**CASE NARRATIVE**

Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW846, 3rd Edition.

Method SW1312/6020 - SPLP Metals  
Method SW1312/7470A - SPLP Mercury

**LOG IN**

Samples were received and log-in performed on 1/20/05. A total of 5 samples were received. The samples were added on from previous DHL work orders (0412014 and 0501027).

**SPLP MERCURY**

For SPLP Mercury analysis sample NM-HB-DRL-1-1 was prepared outside the Hold Time. The sample result is flagged "C".

**DATA REPORTING**

Sample reports include the Method Detection Limit (MDL) and the Reporting Limit (RL) for each analyte. The computer system allows for reporting MDL with 2 significant figures and the RL with 3 significant figures. Because of rounding it may sometimes appear that a "J" flagged result is lower than the MDL if the sample result is very near the MDL.

RE: Sii Smith Services Hobbs NM

Order No.: 0501027

Dear Lee Davis/Kurt Lampi:

DHL Analytical received 7 samples on 1/7/2005 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten signature in black ink, appearing to read "John DuPont".

John DuPont  
General Manager

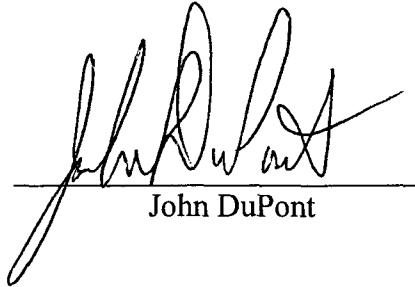

## TABLE OF CONTENTS

This report for SMITH INTERNATIONAL: Sii Smith Services Hobbs NM (DHL Work Order 0501027) contains the following information:

| ITEM  | Page  |
|---|-------|
| • Cover Page  | 1     |
| • Table of Contents   | 2     |
| • Original chain of custody, fedex slip (if used), log-in checklist | 3-5   |
| • Work Order Sample Summary   | 6     |
| • Preparation Dates Report  | 7-9   |
| • Analytical Dates Report   | 10-12 |
| • Sample Results  | 13-41 |
| • Case Narrative  | 42-43 |
| • QC Summary Report   | 44-75 |
| • Total Number of Pages   | 75    |

**Qualifiers** ND - Not Detected at the Method Detection Limit  
J - Analyte detected between MDL and RL  
B - Analyte detected in the associated Method Blank

S - Spike Recovery outside control limits  
C - Sample Result or QC discussed in Case Narrative  
E - TPH pattern not Gas or Diesel Range Pattern

**CASE NARRATIVE**

Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW846, 3rd Edition.

Method SW8260B - Volatile Organics  
Method SW8270C - Semivolatile Organics  
Method SW6020 - Metals Analysis  
Method SW7471A - Mercury Analysis  
Method M8015D - DRO/ORO Analysis  
Method M8015V - Gasoline Range Organics  
Method D2216 - Percent Moisture

**LOG IN**

Samples were received and log-in performed on 1/7/05. A total of 7 samples were received. Sample NM-HB-DRL-1-9 had 1 of 9 VOA vials broken in transit.

**DRO/ORO**

For DRO/ORO analysis performed on 1/13/05 the surrogate recoveries for sample NM-HB-DRL-1-7 and the LCS and ICV were below control limits for o-Terphenyl or Octacosane. These are flagged accordingly. No further corrective actions were required and no sample results were adversely affected.

For DRO/ORO analysis performed on 1/12/05 the matrix spike and matrix spike duplicate recoveries were out of control limits. These are flagged accordingly. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits. No further corrective actions were required and no sample results were adversely affected.

**GASOLINE RANGE ORGANICS**

For GRO analysis performed on 1/10/05 the surrogate recovery for sample NM-HB-DRL-1-7 was slightly below control limits. The sample was re-prepped and re-analyzed which confirmed matrix effect.

**METALS**

For Metals analysis performed on 1/12/05 the matrix spike and matrix spike duplicate recoveries were out of control limits for some analytes. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these analytes. No further corrective actions were required and no sample results were adversely affected.

## CASE NARRATIVE

### SEMIVOLATILES

For Semivolatiles analysis performed on 1/13/05 sample NM-HB-DRL-1-7 was diluted prior to analysis due to the nature of the sample.

For Semivolatiles analysis performed on 1/13/05 the surrogate recoveries sample NM-HB-DRL-1-7 and the matrix spike and matrix spike duplicate were slightly above control limits for 2,4,6-Tribromophenol. These are flagged accordingly in the QC summary report. No further corrective actions were required and no sample results were adversely affected.

### VOLATILES

For Volatiles analysis performed on 1/13/05 sample NM-HB-DRL-1-7 had the low internal response for 1,4-Dichlorobenzene-d4. The sample was re-prepped and re-analyzed which confirmed matrix interference.

For Volatiles analysis performed on 1/7/05 Toluene was detected below the reporting limit in the method blank.

For Volatiles analysis performed on 1/7/05 the matrix spike and matrix spike duplicate recoveries were below control limits for Chlorobenzene and Toluene. In addition, the matrix spike and matrix spike duplicate had the RPD out of control limits for Chlorobenzene. These are flagged accordingly in the QC summary report. The sample selected for the matrix spike and matrix spike duplicate was from this work order. The LCS was within control limits for these compounds. No further corrective actions were required and no sample results were adversely affected.

For Volatiles analysis performed on 1/13/05 the surrogate recovery for sample NM-HB-DRL-1-7 was above control limits for 4-Bromofluorobenzene. No further corrective actions were required and no sample results were adversely affected.

### DATA REPORTING

Sample reports include the Method Detection Limit (MDL) and the Reporting Limit (RL) for each analyte. The computer system allows for reporting MDL with 2 significant figures and the RL with 3 significant figures. Because of rounding it may sometimes appear that a "J" flagged result is lower than the MDL if the sample result is very near the MDL.

RE: Sii Smith Services Hobbs NM

Order No.: 0501091

Dear Lee Davis/Kurt Lampi:

DHL Analytical received 1 sample on 1/18/2005 for the analyses presented in the following report.

There were no problems with the analyses and all data met requirements of NELAC except where noted in the Case Narrative. All non-NELAC methods will be identified accordingly in the case narrative and all estimated uncertainties of test results are within method or EPA specifications.

If you have any questions regarding these tests results, please feel free to call. Thank you for using DHL Analytical.

Sincerely,

A handwritten signature in black ink, appearing to read "John DuPont".

John DuPont  
General Manager

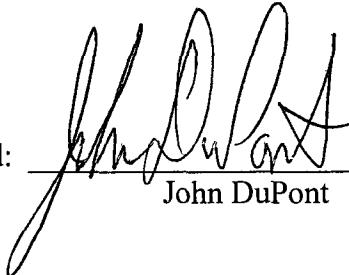

## TABLE OF CONTENTS

This report for SMITH INTERNATIONAL: Sii Smith Services Hobbs NM (DHL Work Order 0501027) contains the following information:

| ITEM  | Page  |
|---|-------|
| • Cover Page  | 1     |
| • Table of Contents   | 2     |
| • Original chain of custody, fedex slip (if used), log-in checklist | 3-4   |
| • Case Narrative  | 5     |
| • Work Order Sample Summary   | 6     |
| • Preparation Dates Report  | 7     |
| • Analytical Dates Report   | 8     |
| • Sample Results  | 9     |
| • QC Summary Report   | 10-11 |
| • Total Number of Pages   | 11    |

**CLIENT:** SMITH INTERNATIONAL  
**Project:** Sii Smith Services Hobbs NM  
**Lab Order:** 0501091

**CASE NARRATIVE**

Test Methods for Evaluating Solid Waste, Physical/Chemical Methods, SW846, 3rd Edition.

Method SW8270C - PAH Analysis  
Method D2216 - Percent Moisture

**LOG IN**

Samples were received and log-in performed on 1/18/05. A total of 1 sample was received. The sample was added on from a previous DHL work order (0501027).

**PAH ANALYSIS**

For PAH analysis, the surrogate recovery for sample NM-HB-DRL-1-7 was above control limits for 4-Terphenyl-d14. This is flagged accordingly. No further corrective actions were taken and the sample was not adversely affected.

For PAH analysis, sample NM-HB-DRL-1-7 was diluted prior to analysis due to the nature of the sample.

For PAH analysis the recovery for the ICV was slightly above control limits for Pyrene. This is flagged accordingly in the QC summary report. No further corrective actions were required and no sample results were adversely affected.

**DATA REPORTING**

Sample reports include the Method Detection Limit (MDL) and the Reporting Limit (RL) for each analyte. The computer system allows for reporting MDL with 2 significant figures and the RL with 3 significant figures. Because of rounding it may sometimes appear that a "J" flagged result is lower than the MDL if the sample result is very near the MDL.

## **APPENDIX C**

### **Field Assessment Procedures**

## **FIELD ASSESSMENT PROCEDURES**

The media of interest and the sampling methods and protocol are described in this attachment.

### **A.1 Sampling Equipment**

The following is a list of sampling equipment that will be used during field activities:

- A Geoprobe® or similar direct-push type soil sampling system;
- Laboratory-supplied containers (i.e., sample jars) for collection of soil samples targeted for laboratory analyses;
- Quality Assurance/Quality Control (QA/QC) samples (e.g. duplicate sample);
- Phosphate-free soap, potable water and deionized water for equipment decontamination;
- U.S. Oil Co. Inc. "Easydraw" syringe (for volatile organic analysis);
- A polyresin trowel;
- Disposable latex and/or nitrile gloves;
- Sample shipping containers (e.g., coolers)

### **A.2 Soil Sampling Procedures**

This section outlines soil sampling procedures to be followed.

#### **A.2.1 Geoprobe® Sampling Procedures**

The Geoprobe® or similar device is a direct-push type sampling machine used to collect soil and/or ground-water samples. The machine advances a soil probe by means of a hydraulic hammer that drives the sampler vertically into the ground. Soil samples will be collected using a 1.5-inch diameter, 36-inch or 48-inch long sampling tube with dedicated, disposable acetate liners. Use of a releasable plunger inside the tube allows the sampler to be advanced to the desired depth and a discrete sample to be collected.

#### **A.2.2 Soil Sample Screening and Collection Procedures**

After retrieving the sampling tube, the liners are cut open and the soil sample field screened by the geologist. The geologist generally selects a "worst-case" soil sample from each location based on the following criteria:

- (1) appeared to exhibit the most prominent staining,
- (2) exhibited the strongest potential chemical odor (or, in the absence of an apparent chemical odor, the strongest anomalous odor, as observed by the geologist)
- (3) Located at or below the bottom of the below ground tank or vessel of concern,
- (4) Located at a specific soil horizon of interest (for example, a fill and native soil contact).

All soil samples are collected above the water table. After sample collection, the soil is visually classified by the geologist and described on the appropriate field sampling form. The soil samples, submitted to the laboratory for analytical testing, are collected using clean one-use disposal gloves and/or a U.S. Oil Co. Inc. "Easydraw" syringe (for volatile organic analysis). Soil samples are placed in either laboratory supplied jars or vials. A polyresin trowel used to break open the soil core is decontaminated between sample points by using a nonphosphate soap wash, distilled water rinse, and air drying.

#### **A.2.3 Boring Abandonment**

Following the advancement of the borings and the collection of soil samples, the borings will be abandoned by backfilling with bentonite chips that are hydrated with clean water. The surface areas at each boring will be patched with concrete or another appropriate surfacing material.

#### **A.3 Equipment Decontamination**

Equipment involved in field sampling activities will be decontaminated prior to drilling, sampling or leaving the facility. During soil sampling, decontamination of the sampling equipment includes the following:

- The removal of visible sediment using a brush and non-phosphatic soap and potable water mixture; and,
- Distilled water rinse.

#### **A.4 Chain-of-Custody Procedures**

Formal chain-of-custody begins when the pre-cleaned sample containers arrive in the field in the laboratory-supplied and sealed cooler. At the time of sample collection, the labeled samples will be placed into an ice-filled cooler. A line-item chain-of-custody form will completed by the sampler. After completion of all of the line items, the sampler signs, dates, lists the time, and confirms the completeness of all descriptive information contained on the form. One copy of the completed chain-of-custody will be retained by the sampler. The following items will be included on the chain-of-custody:

- Sample identification
- Signature of sampler,
- Date and time of collection,
- Sample type (i.e., aqueous or soil),
- Number and type of containers,
- Analytical parameters requested,
- Preservative,
- Signatures of personnel involved in the chain-of-custody of possession, and,
- Dates and times of relinquishment and receipt.

#### **A.5 QA/QC Samples (Only if requested by client or required by agency)**

A QA/QC sample will be collected to assess the quality and precision of the laboratory data resulting from soil sampling. The QA/QC sample is a duplicate soil sample.
