DRAFT PROPOSAL NM99B

**SOIL-GAS SURVEY NEAR PUBLIC SUPPLY WELL 25, HOBBS, NEW
MEXICO**

Rick Huff

November 5, 1998

BACKGROUND AND PROBLEM

The City of Hobbs, New Mexico (fig.1) withdraws water for public supply through a network of wells tapping the Ogallala aquifer. Benzene has been detected in City of Hobbs public supply well number 25 in concentrations ranging from 0.7 to 23.0 micrograms per liter since 1994. Methyl tert-butyl ether (MTBE) has been detected in City of Hobbs public supply well number 25 in concentrations ranging from 3.4 to 52.4 micrograms per liter since 1995 (Anne Dean, City of Hobbs, New Mexico, written commun., 1998). Concentrations of benzene and MTBE in public supply well 25 as a function of time and as a function of approximate ground water withdrawal rate is shown in figures 2 and 3, respectively. Benzene and MTBE are common constituents associated with ground water contaminated by gasoline.

The City of Hobbs has an interest in determining the direction from which benzene and MTBE contamination are entering public supply well number 25. A soil gas survey of the accessible area around well 25 may give information on the shape, size, and orientation of any contaminant plumes present.

OBJECTIVES AND SCOPE

The objective and scope of the proposed work is to collect soil-gas data in the accessible area around public supply well 25 as shown in figure 1. All proposed work will be carried out in federal fiscal year 1999.

APPROACH

Soil gas samples will be extracted from approximately five feet below land surface using a geoprobe designed for soil gas collection. Gas samples will be analyzed in the field using a portable gas chromatograph and ionization detector. Standards containing common gasoline constituents will be used to calibrate the analysis system. Baseline values for determination of relative amounts of constituents in soil-gas samples will be established by analysis of organic-free air. All sampling locations will be accurately determined using standard surveying techniques. This approach should provide data on the types and relative abundances of vapors associated with potential subsurface gasoline contamination.

QUALITY CONTROL PLAN

Organic free air samples will be analyzed between each sample analysis to establish background values. Gasoline constituent standards will be analyzed following analysis of approximately every third soil-gas sample.

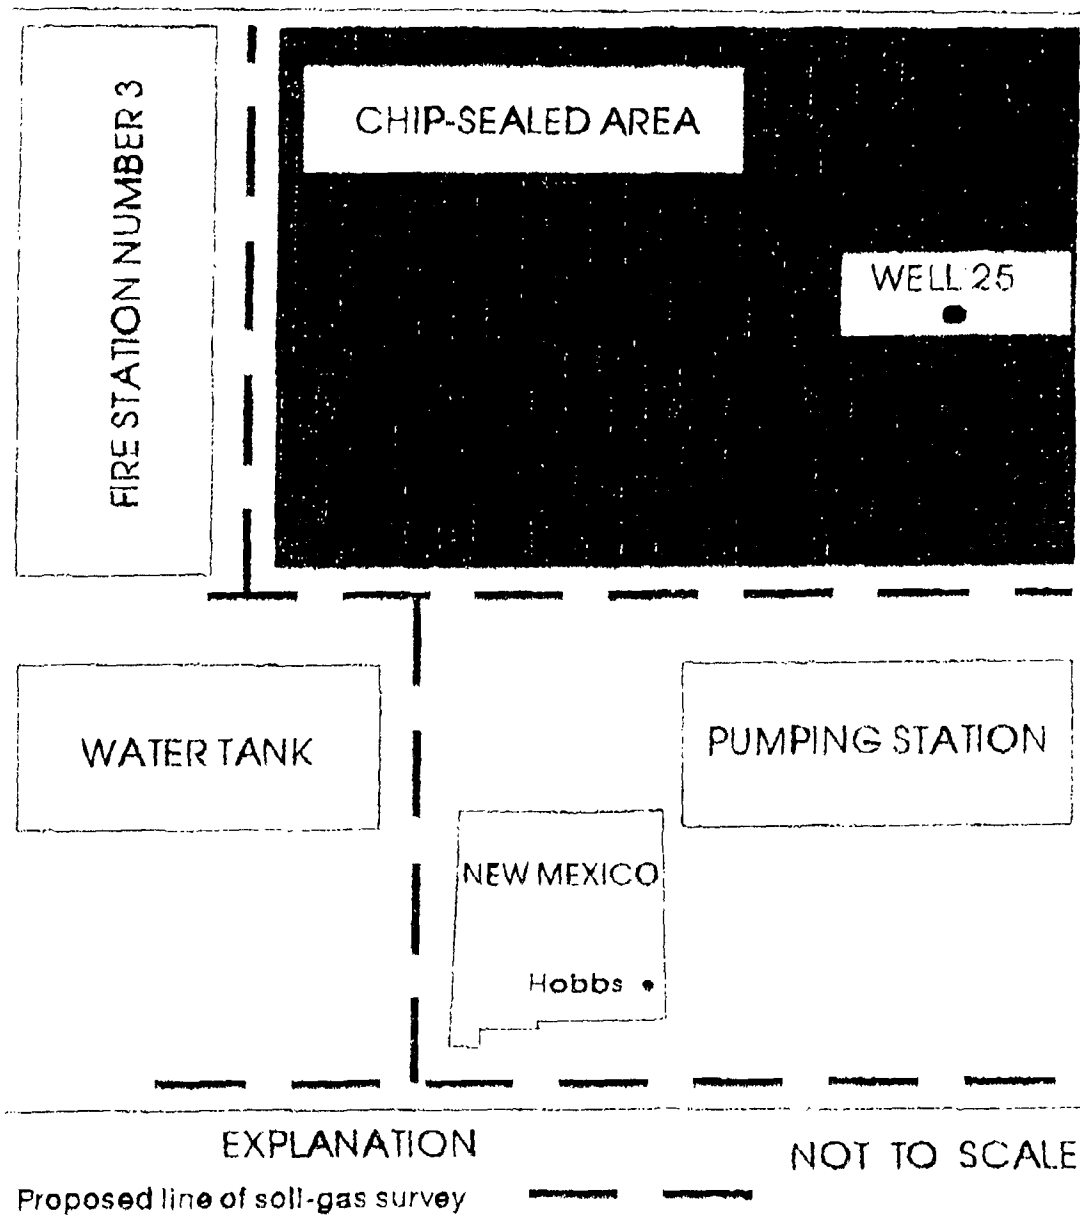

Figure 1.--Location of Hobbs, New Mexico and detailed locations of soil-gas surveys

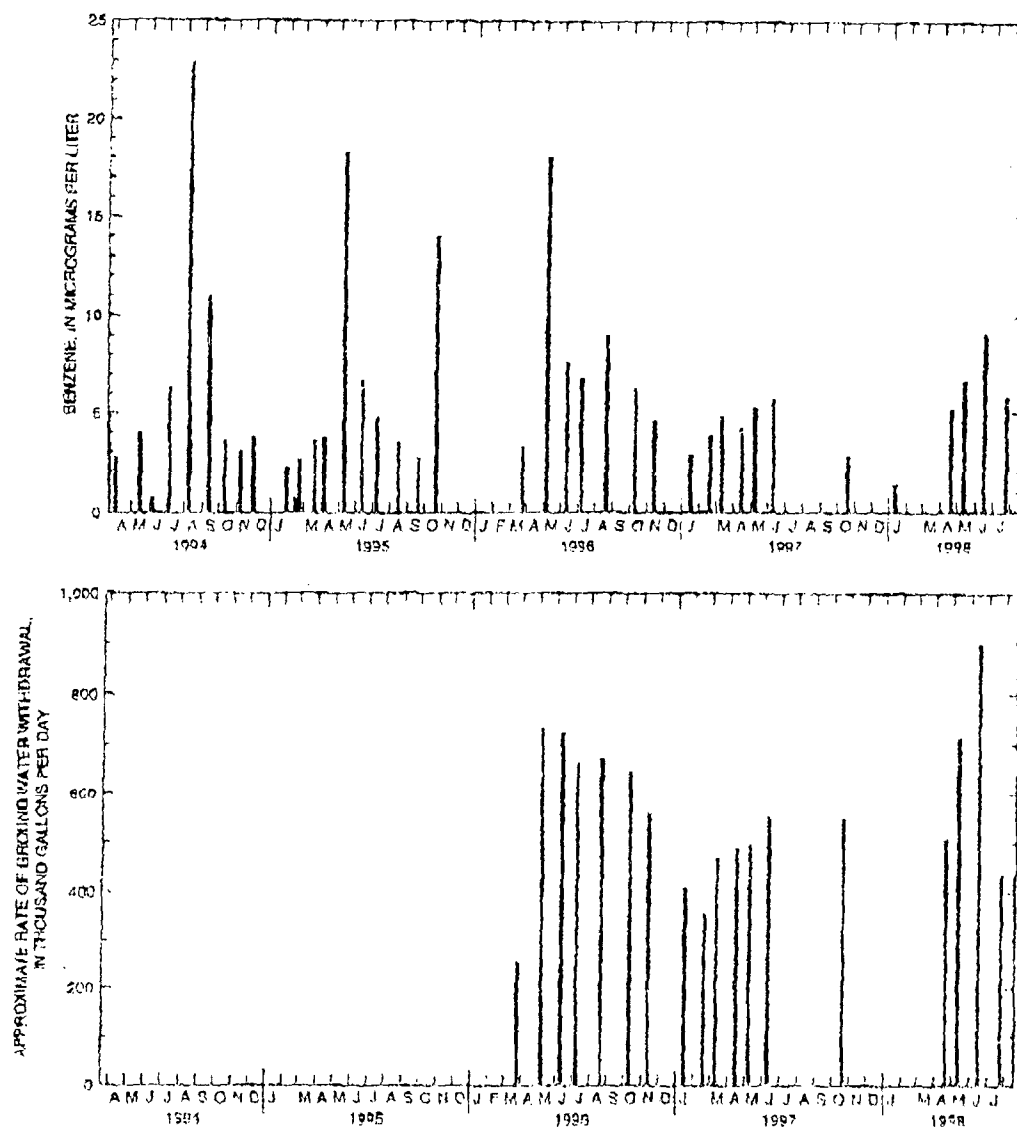

Figure 2.--Concentrations of benzene in water from well 25 as a function of time and approximate rates of ground water withdrawal from well 25 as a function of time (data from City of Hobbs, New Mexico).

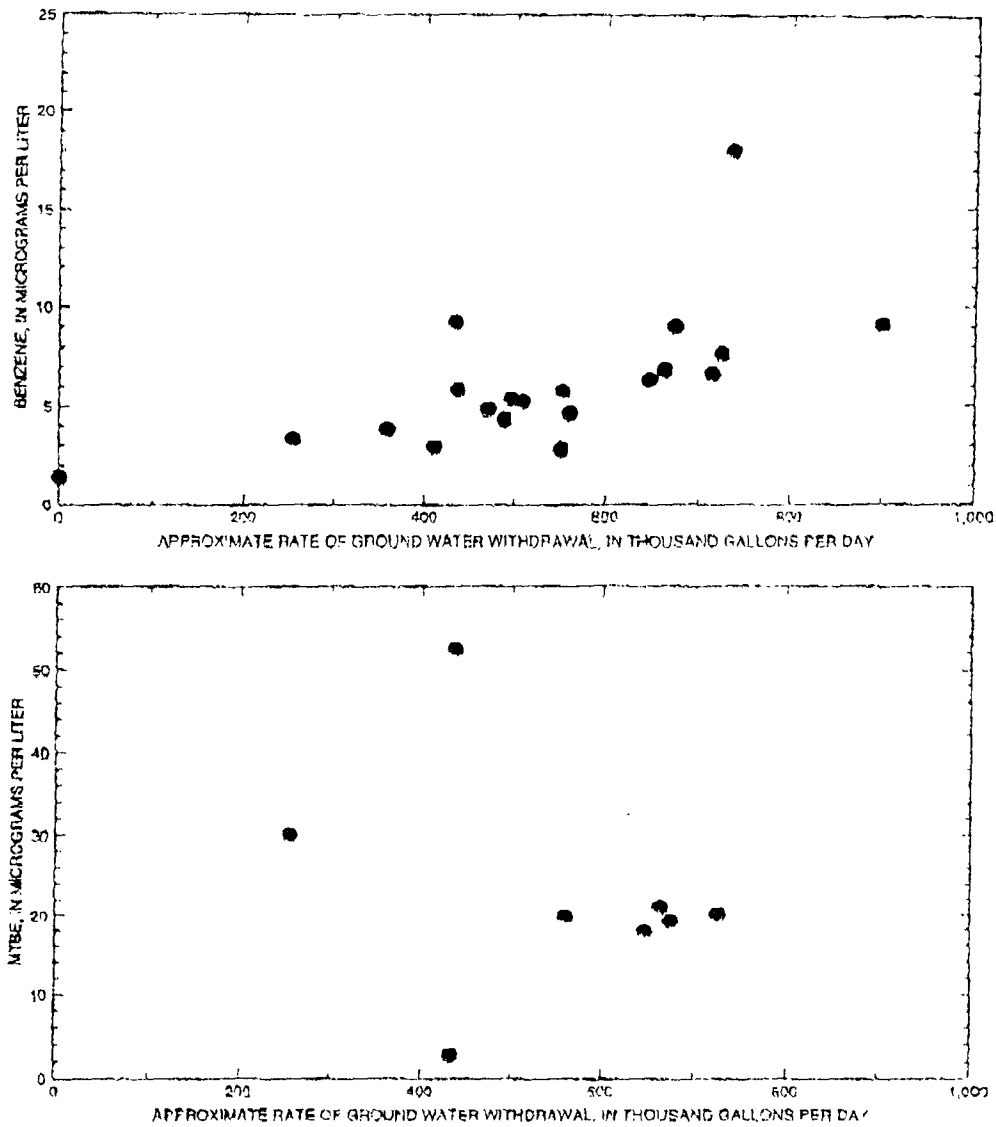

Figure 3.--Concentrations of benzene and MTBE in water from well 25 as a function of approximate rates of ground water withdrawal from well 25 for the period of March, 1996 to August, 1998 (data from City of Hobbs, New Mexico).

BENEFITS

Benefits to the City of Hobbs include data on the subsurface distribution of soil-gas vapors associated with subsurface gasoline contamination. These data may be valuable in determining the type of magnitude of any remediation efforts that may take place.

PRODUCTS

All data collected on the location, type, and relative abundance of soil gases will be made available to the City of Hobbs, New Mexico.

PERSONNEL REQUIREMENTS

All personnel required for the proposed work are employed in the New Mexico District Office and Las Cruces Subdistrict office of the USGS. Personnel required for this project include a GS-12 project chief (6 percent of annual time) and a GS-10 hydrologic technician (4 percent of annual time).

WORKPLAN

All work described in this proposal will be completed by the end of the second quarter (March 31, 1999) of the 1999 federal fiscal year.
