**RE: Amended Workplan Results for the Jaquez COM E #1 and C #1.**

Dear Mr. Pope:

Philip Environmental Services Corp. (Philip) has prepared this letter report for El Paso Field Services (EPFS) as requested in the New Mexico Oil Conservation Division's (OCD) letter dated May 15, 2000. This report describes the recent soil remediation activities included in the amended work plan dated January 12, 2000, for the EPFS Jaquez Com E #1 and C #1 gas production site.

**BACKGROUND**

On June 25, 1999 Mr. John Jaquez informed EPFS that he had encountered "blackened smelly soil at a depth of 8-12 inches". This soil was located in the southern part of the location that is known as the garden area (Figure 1). EPFS agreed to investigate Mr. Jaquez's complaint and on June 30, 1999, EPFS laboratory personnel met Mr. Denny Foust of the OCD at the location and collected soil samples from the areas in question with a hand auger.

On August 13, 1999, EPFS submitted a letter to the OCD with the results of the June 30, 1999, investigation that included a proposed work plan for further investigation of potential hydrocarbon impacts of soil and ground water at the location. The proposed work plan included the installation of one monitor well north of "Citizens Ditch." The monitor well would be installed, developed, and sampled according to standard installation procedures. On the south side of "Citizens Ditch," another monitor well would be installed and soil borings and hand auger holes completed across the garden area to evaluate potential hydrocarbon impacted soils and ground water quality. On September 22, 1999, The OCD approved the work plan with modifications.

Due to continued concerns raised by Mr. Jaquez, Philip performed additional exploratory excavations for EPFS on November 24, 1999, to investigate soils that Mr. Jaquez thought were impacted by hydrocarbons. On December 17, 1999, Scott Pope and Sandra Miller of

*Combining the Strengths of Philip Services Corp., Allwaste and Serv-Tech*

EPFS, Denny Foust and Bill Olson of the OCD, and Cecil Irby of Philip met with Mr. Jaquez to discuss the results of the November 24, 1999, investigation and to address additional concerns raised by Mr. Jaquez. As a result of this meeting, the Scope of Work for the August 13, 1999, Work Plan was significantly changed. Trenching north and south of "Citizens Ditch" was conducted to replace the proposed soil borings and hand auger holes. The results of the trenching and amended work plan were submitted to the OCD on January 12, 2000. This letter report describes the activities as directed by the amended work plan and addresses requirements of the May 15, 2000, approval letter from the OCD.

#### **INSTALLATION OF ADDITIONAL MONITOR WELLS**

On January 11 and January 12, 2000, Philip personnel installed two 4-inch diameter monitor wells, M-06 and R-06. R-06 was installed according to the August 13, 1999, Work Plan submitted to the OCD by EPFS and M-06 was installed as requested by the OCD and agreed to in the December 17, 1999, meeting between EPFS, OCD, Philip, and Mr. Jaquez. The two monitor wells were completed according to New Mexico Oil Conservation Division guidelines for monitor well installation, construction, and well development dated August 13, 1993. Geologic logs and well completion diagrams are included as Attachment 1. The monitor wells were drilled using a CME-75 drill and 6- 1/4 inch inside diameter hollow stem augers. The wells were completed using 15 feet of 4-inch diameter PVC Schedule 40 .010-inch machine slotted screen and a 4-inch diameter PVC Schedule 40 casing. A 10-20 grade silica sand filter pack was installed to approximately two feet above the screen. A two-foot thick bentonite seal was placed on the filter pack and hydrated with potable water. A 6-inch thick seal was installed at M-06 due to shallow ground water. The remaining annulus was sealed with a cement-bentonite grout. One monitor well, R-06, was completed with a 3.5-foot by 8-inch diameter lockable protective casing and the other monitor well, M-06, was completed with a flush mount casing.

On January 19 and January 20, 2000 the two new monitor wells were developed by purging 3 well casing volumes of ground water until the temperature, pH, and conductivity of the purge water had stabilized. After stabilization, the ground water from each monitoring well was sampled for benzene, toluene, ethylbenzene, and total xylenes (BTEX) and analyzed by US Environmental Protection Agency Method 8021 Modified. In addition, ground water from the other ten monitor wells at the site was purged and sampled for the same analytes.

Ground water samples were collected in pre-cleaned pre-preserved 40-milliliter glass vials supplied by the laboratory. The ground water samples were immediately labeled, sealed, and placed on ice. Chain-of-custody forms were filled out for each sample and the samples shipped to Pinnacle Laboratories located in Albuquerque, New Mexico.

Sampling results are included in Table 1 and Laboratory Quality Assurance/Quality Control data are included as Attachment 2. Analytical results for groundwater samples collected during March, April, May and June, 2000 are also included in Table 1. Laboratory analytical

reports for the March, April, May and June sampling will be included in the annual report and are available upon request.

#### **EXISTING IRRIGATION WELL**

The existing 6-inch diameter irrigation well was sampled on February 3, 2000. The irrigation well was developed using a stainless steel, 2-inch diameter submersible Grundfos™ pump by purging 3 well casing volumes until temperature, pH, and conductivity parameters stabilized. The well was then sampled with a clean disposable bailer for BTEX and analyzed by USEPA Method 8021 Modified according to the procedures described above. Sampling results are included as Table 2 and Laboratory Quality Assurance/Quality Control data are included as Attachment 3.

#### **CITIZENS DITCH SAMPLING**

On June 1, 2000, Philip personnel collected water samples from "Citizens Ditch" both upgradient and downgradient of the Jaquez COM E #1 and COM C #1 site for BTEX and analyzed by USEPA Method 8021 Modified. Samples were collected as grab samples from the sides of "Citizens Ditch." Sampling results are included as Table 3 and Laboratory Quality Assurance/Quality Control data are included as Attachment 4.

#### **EXCAVATION OF WESTERN BOUNDARY OF GARDEN AREA**

On June 8, 2000, EPFS notified the New Mexico Oil Conservation Division (OCD) that work included in the amended work plan was to begin on Tuesday, June 13, 2000.

On June 14 through June 16, 2000, Philip personnel excavated approximately 204 cubic yards of soil from the northwestern corner of the garden area. The area excavated was 46 feet in length by 20 feet in width by 6 feet in depth. At approximately 5 feet below ground surface, ground water was encountered and made excavation difficult below this depth. On site personnel included Bruce Martin and Henry Villanueva of the OCD, Scott Pope of EPFS, Stephen Stellavato, Mike Stahle, and Mike Hare of Philip, and Mrs. Jaquez, the landowner.

The excavated material was separated according to field screening analysis using a photoionization detector (PID) as well as visual observation to stockpile clean soils. Near monitor well M-03, on the north side of the excavation, black soils were located approximately 3.5 feet below ground surface. East of monitor well M-03, black soils were located 5.5 feet below ground surface. Field headspace analysis indicated readings of 899 parts per million (PPM) from the black soils. Approximately 3 feet below ground surface, suspected hydrocarbon impacted soils were removed from the site and delivered to Envirotech for landfarming. The Bill of Lading for the contaminated soils is included as Attachment 5.

Mr. Scott Pope  
July 21, 2000  
Page 4 of 5

Soil samples 1,2,3,5, and 6 were collected from the excavation at the soil/ground water interface approximately 3.5 to 4 feet beneath ground surface. Soil sample 4 was collected at approximately 6 to 6.5 feet beneath the ground surface, beneath the ground water interface, to characterize the bottom of the excavation. Locations of the soil samples are shown on Figure 2. Soil samples 1-4 were split with the on-site OCD personnel and sent for laboratory analysis for BTEX by USEPA Method 8021 Modified and total petroleum hydrocarbons (TPH) by USEPA Method 418.1 and 8015 Modified. All soil samples were collected in glass jars, labeled with the sampling location, date, time, analysis required, sealed with security tape, placed on ice, and chain-of-custody completed. Samples were then delivered to the laboratory within required holding times. Initially, only BTEX analysis was requested on the chain of custody forms, therefore TPH analysis was requested by telephone and analysis completed one day past the recommended sample holding time. Because holding times for TPH were exceeded for the samples collected on June 14, 2000, these samples were analyzed by both 418.1 and 8015 methods for comparison of the results. Analytical results are included as Table 4 and Laboratory Quality Assurance/Quality Control data are included as Attachment 6.

Backfilling of the excavation included placing 98.79 tons of 3-inch minus aggregate rock in the bottom of the excavation per the request of the landowner. Clean soils were then backfilled and mixed with approximately 15 tons of livestock manure and disked-in with a tractor and back-dragged with a backhoe. Weeds and debris were removed and sent to the San Juan County Landfill.

On June 20, 2000, 70 gallons of urea nitrate mixed with 600 gallons of potable water were injected into the passive air system south of the ditch as shown on Figure 1. The urea nitrate is a nutrient source for the indigenous microorganisms that will naturally degrade any hydrocarbons that may remain at the site.

#### **TEMPORARY MONITOR WELLS**

On July 7, 2000, two temporary monitor wells were installed in the garden area as shown on Figure 1. The temporary wells were installed with a hand auger to a depth of six feet below ground surface and ground water was encountered at approximately 2.8 feet below ground surface at TMW-01 and 2.3 feet below ground surface at TMW-02. Geologic logs and well completion diagrams are included as Attachment 7. On July 13, 2000, the temporary wells were developed by purging approximately one gallon of ground water from each monitor well and collecting water samples for BTEX analysis by USEPA Method 8021 Modified. The temporary wells bailed dry and ground water samples were collected after the wells recharged. Water samples were collected three times on three different days due to "carbonation" of the ground water samples that left headspace in the sampling bottles. The ground water samples collected on July 13, 2000 were sent to the laboratory for analysis. Sampling results are included in Table 1 and Laboratory Quality Assurance/Quality Control

data are included as Attachment 8. A ground water potentiometric surface contour elevation map is included as Figure 3.

## CONCLUSIONS

The installations of the two additional monitor wells, R-06 and M-06, indicated ground water quality below New Mexico Water Quality Control Commission (NMWQCC) ground water standards. Groundwater from the existing 6-inch irrigation well near the residence was also below NMWQCC ground water standards. Water samples collected upgradient and downgradient from "Citizens Ditch" indicated no surface water quality violations. The two temporary monitor wells installed in the garden area encountered a thin layer of suspected hydrocarbon impacted soils during installation near the soil/water interface at approximately 3 feet below ground surface. Analytical results from the ground water samples collected at the temporary wells are free of BTEX.

The excavated area in the northwest corner of the garden area indicated hydrocarbon impacted soils to the north side of the excavation at the soil/water interface. This area to the north of the excavation is an unexcavated area that was left in place from the original remediation due to the potential to breach "Citizens Ditch." The hydrocarbon impacted soils terminated on the south and west sides of the excavation. The black soils to the east were 6 feet or more below ground surface which represented the termination of the original excavation. Despite the appearance of the black soils, the soil samples indicate that BTEX and TPH were below OCD Standards.

## RECOMMENDATIONS

As shown on Figure 3, the direction of the hydraulic gradient trends to the south-southwest. Excavated soil analysis of the suspected hydrocarbon impacted soils show levels of BTEX and TPH below recommended remediation levels. The garden area has been completely excavated with the eastern and western boundary defined as not impacted by suspected hydrocarbons. The area north of monitor wells M-03 and M-04 may possess suspected hydrocarbon impacted soils as observed during the excavation. A possible solution to dealing with the suspected hydrocarbon impacted soils north of the garden area could be to evaluate the potential for implementation of soil vapor extraction and ground water sparging. Another possibility is for soil vapor extraction from the existing passive system and/or installing an additional trench with additional sparge wells.

Sincerely,  
**PHILIP ENVIRONMENTAL SERVICES CORPORATION**

Stephen Stellavato  
Geologist

The diagram illustrates the cross-section of the well borehole. It shows three concentric cylindrical sections. The outermost section is labeled 'Protective Casing'. Inside it is a smaller section labeled 'Permanent Borehole Casing'. The innermost section is labeled 'Well Riser'. Below the well riser, there is a layer labeled 'Gravel Pack' represented by a hatched pattern. At the very bottom of the borehole, there is a layer labeled 'Screen'.

Attention:                    ROBERT THOMPSON/LEAUDRA STANLEY

On 06/16/00 Pinnacle Laboratories, Inc. Inc., (ADHS License No. A20592 pending), received a request to analyze non-aq samples. The samples were analyzed with EPA methodology or equivalent methods. The results of these analyses and the quality control data, which follow each set of analyses, are enclosed.

Per the client request, samples were reaccessioned to include diesel analyses.

If you have any questions or comments, please do not hesitate to contact us at (505)344-3777.

A handwritten signature in black ink, appearing to read "H. Mitchell Rubenstein".
