1.0 INTRODUCTION

Environmental Technology Group, Inc. (ETGI) conducted a subsurface investigation of this former pit location on behalf of Yates Petroleum Corporation (Yates). The investigation was conducted in order to document subsurface conditions resulting from operations at the former pit.

The site is located in the NE1/4 of the NW1/4 of Section 25, Township 18S, Range 26 East in Eddy County, New Mexico as depicted on Figure 1, the Site Location Map. The former pit area measures approximately 90 feet by 130 feet. The southwestern portion of the pit appears to have been in operation later than the remaining portion of the pit. However, the entire pit area is no longer in use and has been backfilled. The boring locations are depicted on Figure 2, the site map.

2.0 SUMMARY OF FIELD ACTIVITIES

ETGI mobilized a rotary drilling rig to the site on October 21, 2000. Mr. Ken Dutton, Field Operations Manager and Camille Reynolds supervised the field activities. David Haggith, Environmental Coordinator for Yates and Mike Stubblefield, representative of the New Mexico Oil Conservation Division (OCD), were also present.

Atkins Engineering, of Roswell, New Mexico, performed the drilling with Mort Bates, Senior Driller, in charge of the drilling rig. A total of five soil borings were advanced at the site. One soil sample was collected from soil borings SB-1, SB-2 and SB-3 at a depth of 10-12 feet bgs, which was total depth for these borings. Soil boring SB-4 had one sample collected from 17-19 bgs, which was also at total depth. Samples were collected from soil boring SB-5 at depths of 10-12, 17-19 and 24-26 feet bgs.

A ground water sample was collected from this boring for analysis. Both the depth to ground water and the total depth were approximately 40 feet bgs. Immediately after the soil and ground water samples were collected, the borings were backfilled with bentonite in order to prevent the potential for vertical migration of hydrocarbons or chlorides.

A chloride field test was conducted on each sample and a Photoionization Detector (PID) was utilized to screen Volatile Organic Compounds (VOCs). Proper QA/QC procedures were followed during all sampling procedures as described below. Each soil; and ground water sample was submitted to Environmental Lab of Texas to be tested for Benzene, Toluene, Ethyl Benzene and Xylenes (BTEX, EPA Method 8021B), Total Petroleum Hydrocarbons (TPH, EPA Method 8015 Modified GRO/DRO) as well as Chlorides (EPA Method 9253).

3.0 SITE DESCRIPTION

3.1 Regional Geology/Hydrogeology

The site is located approximately one half mile west of the west channel of the Pecos River and one and one half mile south of the intermittent stream, Rio Penasco. This places it in the geographic feature known as Orchard Park Terrace, which is only slightly dissected and slopes at about five degrees to the east. Surface drainage is to the east toward the west channel of the Pecos River.

The site is located on Quaternary alluvium associated with the Pecos River flood plain and drainages originating in the Sacramento Mountains to the west. The alluvium is underlain by the Triassic age Dockum Group which consists primarily of red silts and sands which are slightly to moderately indurated. The Dockum Group is approximately 1,000 feet thick in the site area and is divided into the Pierce Canyon redbeds and Santa Rosa sandstone in the site vicinity. These formations are unconformably underlain by the upper Permian Rustler Formation (gypsum, redbeds and dolomites) which is unconformably underlain by the middle Permian Chalk Bluff Formation (back reef deposits of dolomite, evaporites, redbeds and sandstone).

This area is located near the eastern margin of the Roswell Basin physiographic province, a north-south trending feature located between the Sacramento Mountains to the west and the Permian Basin to the east. Within this feature, ground water commonly occurs in the alluvium near the Pecos River and in the Permian formations throughout the feature. Aquifers within the Triassic Dockum group are usually thin and discontinuous resulting in poor quality and low volumes.

In the site vicinity, ground water generally flows to the southeast toward the downgradient direction of the west channel of the Pecos River, which joins the main channel at the confluence with Brantley Reservoir. The east-west trending intermittent streams appear to have little influence on the regional gradient, however local variations may occur in the vicinity of these drainages during precipitation events.

Data collected by the United States Weather Bureau indicate that the average annual precipitation in the site vicinity is approximately 12.4 inches. This amount occurs primarily as storm events during the period between June and October. Infiltration from these events are commonly minimal given the high rates of surface runoff and evaporation.

3.2 Site Geology/Hydrology

The soil borings indicate that the pit was excavated to between 5 to 10 feet bgs. The backfill material was underlain by a red-brown, fine-grained sand with occasional caliche nodules and thin stringers of sandy clay.

The sand was dry to a depth of approximately 38 feet bgs where the capillary fringe was detected. Measurements taken in the uncompleted borehole indicate that the water table is located at approximately 40 feet bgs in the unconsolidated alluvial sand.

3.3 New Mexico Oil Conservation Division (NMOCD) Soil Classification

During the site investigation, no soils that may be characterized by OCD guidelines as Highly Contaminated/Saturated Soils were detected at the site. Based on PID data and subsequent laboratory data, host soils at the site were generally clean with no significant staining or odor.

The depth to groundwater, as measured from the lowermost zone of Highly Contaminated/Saturated Soils is approximately 40 feet. This interval is less than the 51 foot interval required for an OCD Ranking of less than 20 points.

The water well database, maintained by the state engineer's office, was accessed in order to determine the location and type of nearby water wells in the area. The data indicate that there are no water wells located within 1,000 feet of the site. This radius and the location of water wells in the vicinity are provided as Figure 3.

As depicted on Figures 1 and 2, there are no bodies of surface water located within 1,000 feet of the site. These site conditions result in an OCD Ranking of greater than 19 points. The action levels for a site with a Ranking Score of greater than 19 are as follows:

- Benzene - 10 ppm
- BTEX - 50 ppm
- TPH - 100 ppm

3.4 Distribution of Hydrocarbons in the Unsaturated Zone

During the site investigation, no soils that may be characterized by OCD guidelines as Highly Contaminated/Saturated Soils were detected at the site. Based on PID data and subsequent laboratory data, host soils at the site were generally clean with no significant staining or odor.

3.5 Distribution of Hydrocarbons in the Saturated Zone

The ground water sample collected from soil boring SB-5 exceeded OCD regulatory standards for benzene and BTEX. The sample was below the OCD regulatory levels for toluene, ethylbenzene, xylenes and was below the method detection limit for TPH.

3.6 Distribution of Chlorides in the Unsaturated Zone

Elevated levels of chlorides were detected in the unsaturated zone throughout the site. Concentrations of chlorides generally increased with depth in soil boring SB-5 between 10 to 26 feet bgs. The maximum soil chlorides level of 11,108 mg/Kg was detected in the sample from soil boring SB-5 at a depth of 24 to 26 feet bgs.

3.7 Distribution of Chlorides in the Saturated Zone

The ground water sample collected from soil boring SB-5 was found to have 30,842 mg/L chlorides concentration. Background data for chlorides concentrations in the area, as determined from the state engineers database (Appendix C), are in the range of 400 to 600 mg/L.

4.0 SUMMARY AND CONCLUSIONS

The site has an OCD Ranking Score of 20 points. The soil action levels for a site with this score are as follows:

- Benzene - 10 ppm
- BTEX - 50 ppm
- TPH - 100 ppm

None of the soils observed in the host soil appear to exceed these criteria. None of the back fill material appears to be impacted by hydrocarbons.

The ground water sample collected from SB-5 was found to have a benzene concentration of 0.535 mg/L, which is in excess of OCD standards. The concentrations of toluene, ethylbenzene and xylenes were below regulatory limits and TPH concentrations were below the method detection limit.

Elevated levels of chlorides were detected in the unsaturated zone throughout the site with slightly lower concentrations present in the western portion of the western pit. The chlorides concentrations did not appear to vary greatly with depth. The maximum soil chlorides level of 11,108 mg/Kg was detected in the sample from soil boring SB-5 at a depth of 24 to 26 feet bgs.

The ground water sample collected from soil boring SB-5 was found to have 30,842 mg/L chlorides concentration. Background data for chlorides concentrations in the area, as determined from the state engineers database (Appendix C), are in the range of 400 to 600 mg/L.

A search of the state engineer's database indicates that there are no domestic water wells within 1,000 feet of the site. In addition, no listed water wells were present in the assumed downgradient direction to the south-southeast (USGS and state engineer's office data).

The assumed gradient of south-southeast is based on the assumption that the west channel of the Pecos River is a "Gaining Stream". Therefore, ground water from the site would have to intersect the streambed at an elevation less than that observed at the site. Based on the USGS topographic map, the site elevation is approximately 3285 feet msl. Given that the depth to ground water at the site is 40 feet, the estimated elevation of ground water at the site is 3245 feet msl. The nearest Pecos river streambed elevation of 3250 feet msl or less is located over two miles from the site. Therefore, the capacity for the impacted ground water observed at the site, to impact the quality of water in the Pecos River, seems minimal.

5.0 QA/QC PROCEDURES

5.1 Soil Sampling

Samples of subsurface soils were obtained utilizing either a split spoon sampler (air rotary drilling rig) or a two-inch, continuous sampling tube with a clean polybuterate liner (Geo-Probe®). Representative soil samples were divided into two separate portions using clean, disposable gloves and clean sampling tools. One portion of the soil sample was placed in a disposable sample bag. The bag was labeled and sealed for headspace analysis using a photoionization detector (PID) calibrated to a 100 ppm isobutylene standard. Each sample was allowed to volatilize for approximately thirty minutes at ambient temperature prior to conducting the analysis.

The other portion of the soil sample was placed in a sterile glass container equipped with a Teflon-lined lid furnished by the analytical laboratory. The container was filled to capacity to limit the amount of headspace present. Each container was labeled and placed on ice in an insulated cooler. Upon selection of samples for analysis, the cooler was sealed for shipment to the laboratory. Proper chain-of-custody documentation was maintained throughout the sampling process.

Soil samples were delivered to Environmental Lab of Texas, Inc. in Midland, Texas for BTEX and TPH analyses using the methods described below. Soil samples were analyzed for BTEX and TPH-GRO/DRO within fourteen days following the collection date.

The soil samples were analyzed as follows:

- BTEX concentrations in accordance with EPA Method 8021B, 5030

- TPH concentrations in accordance with modified EPA Method 8015M GRO/DRO

5.2 Ground Water Sampling

Monitoring wells were developed and purged with a clean PVC bailer. The bailer was cleaned prior to each use with Liqui-Nox[7] detergent and rinsed with distilled water. Monitoring wells with sufficient recharge were purged by removing a minimum of three well volumes. Monitoring wells that do not recharge sufficiently were purged until no additional ground water can be obtained.

After purging the wells, ground water samples were collected with a disposable Teflon sampler and polyethylene line by personnel wearing clean, disposable gloves. Ground water sample containers were filled in the order of decreasing volatilization sensitivity (i.e., BTEX containers will be filled first and polynuclear aromatic hydrocarbons (PAH) containers second).

Ground water samples collected for BTEX analysis were placed in 40 ml glass VOA vials equipped with Teflon lined caps. The containers were provided by the analytical laboratory. The vials were filled to a positive meniscus, sealed, and visually checked to ensure the absence of air bubbles.

Ground water samples collected for PAH analysis were filled to capacity in sterile, one liter glass containers equipped with Teflon lined caps. Ground water samples collected for metals analysis were filled to capacity in sterile, one liter plastic containers equipped with Teflon lined caps. The containers were provided by the analytical laboratory.

The filled containers were labeled and placed on ice in an insulated cooler. The cooler was sealed for transportation to the analytical laboratory. Proper chain-of-custody documentation was maintained throughout the sampling process.

The ground water samples were analyzed as follows:

- BTEX concentrations in accordance with EPA Method 8021B, 5030
- TPH concentrations in accordance with modified EPA Method 8015-GRO/DRO

5.3 Decontamination Of Equipment

Cleaning of drilling equipment was the responsibility of the drilling company. In general, the cleaning procedures consisted of using high pressure steam to wash the drilling and sampling equipment prior to drilling and prior to starting each hole. Prior to use, the sampling equipment was cleaned with Liqui-Nox[7] detergent and rinsed with distilled water.

5.4 Laboratory Protocol

The laboratory was responsible for proper QA/QC procedures after signing the chain-of-custody form. These procedures were either transmitted with the laboratory reports or are on file at the laboratory.

6.0 LIMITATIONS

Environmental Technology Group, Inc. has prepared this Preliminary Investigation Report to the best of its ability. No other warranty, expressed or implied, is made or intended.

Environmental Technology Group, Inc. has examined and relied upon documents referenced in the report and has relied on oral statements made by certain individuals. Environmental Technology Group, Inc. has not conducted an independent examination of the facts contained in referenced materials and statements. We have presumed the genuineness of the documents and that the information provided in documents or statements is true and accurate. Environmental Technology Group, Inc. has prepared this report in a professional manner, using the degree of skill and care exercised by similar environmental consultants. Environmental Technology Group, Inc. also notes that the facts and conditions referenced in this report may change over time and the conclusions and recommendations set forth herein are applicable only to the facts and conditions as described at the time of this report.

This report has been prepared for the benefit of Yates Petroleum Corp. The information contained in this report including all exhibits and attachments, may not be used by any other party without the express consent of Environmental Technology Group, Inc. and/or Yates Petroleum Corp.
