RE: 1999 SAN JUAN BASIN ANNUAL GROUNDWATER REPORT

Dear Bill:

PNM is pleased to submit the 1999 Annual Groundwater Report on Unlined Surface Impoundments in the San Juan Basin. Pursuant to PNM's Groundwater Management Program for Unlined Surface Impoundment Closures, the report details the ongoing investigation/remedial activities at unlined surface impoundments having groundwater contamination as identified by PNM. A list of groundwater sites reported in this document is provided below.

Blanco Wash Drip	Mangum 1E
Davis 1	McClanahan 22
Dogie East Pit	McClanahan A 2E
Dogie North Pit	McCoy Gas Com A1
Florance 124	Miles Federal 1E Drip
Florance 32A	O' Shea 1M
Florance 40	Patterson A Com A1
Florance 44	Pritchard 2
Florance M 47X	Randleman 1
Hampton 4M	Reid 16 Drip
Honolulu Drip	Turner 1A
Ice Canyon Drip	Wilmerding 1M
Jacques 2A	Zachry 18E
Jicarilla Contract 147-6	
Linda 1A	

Consistent with PNM's San Juan Basin Groundwater Management Plan, PNM will request closure of four of the above sites, the Florance 32A, Jacques 2A, Mangum 1E and the McClanahan A2E, with the submittal of the 1st Quarter 1999 Pit Closures Report. This request is based upon the analytical data collected over the last two years at each of the sites. BTEX concentrations have been consistently below WQCC standards for four consecutive quarters.

Upon approval of the groundwater closure report, PNM will plug and abandon all of the groundwater monitoring wells at each of the locations. The concrete pad and metal vault surrounding each well will be removed. The well casing will be cut to ground surface and each well will be plugged to the surface

Site Hydrology:

The Honolulu Drip site is located on the southern edge of Tapecito Wash. Tapecito is a tributary to Largo Canyon, in the far southeast part of its drainage area. The site lies at an elevation of about 7000 ft. amsl. The valley floor of Tapecito Wash is just north and northwest of the site. Elevations drop towards the southwest, along the valley floor.

In general, materials beneath the site are silty, fine sands. The depth to water is about seven feet. On the south part of the site, elevations rise abruptly as the topography ascends a terrace level. Groundwater flow has been towards the southwest, parallel to the course of Tapecito Wash. The hydrograph, Figure 3, shows seasonal water level variations are on the order of 2 feet or more.

Activities for Previous Year:

PNM conducted quarterly groundwater sampling on May 19, July 23, 1998, and again on February 11, 1999. Prior to sampling, water level measurements were taken in each of the monitor wells. Samples from all wells were analyzed for benzene, toluene, ethylbenzene, and xylenes (BTEX) using EPA Method 8020. Sampling was performed in strict compliance with EPA protocol. PNM delivered the samples to OnSite Technologies, Farmington, New Mexico.

During the month of December, 1998, extensive source remediation was conducted at the Honolulu Loop Line Drip site. Approximately 1800 cubic yards of contaminated soil were remediated along the southern portion of the Tapecito Wash, east and west of Williams Field Service' pipeline (Figure 1a). In the process, monitor wells, MW-2, -3, -4, -6, -9 and -10, were removed. On February 1, 1999, three new monitor wells were installed at the site (MW-11, -12 and -13). The wells were placed to provide adequate coverage to the east and northeast, and in the vicinity of former well MW-6, which has historically contained the highest benzene concentrations.

Results:

Figure 1 is a site map of the Honolulu Loop Line Drip and includes groundwater analytical results as an attachment. For the past three quarter, benzene concentrations in MW-5 have increased and are above WQCC standards. Concentrations of benzene in well, MW-7, have increased to above the standard during the previous quarter. PNM believes that with the recent additional remediation, contaminant levels in these wells will begin to decrease within the next few quarterly monitoring events. Results in monitor wells MW-12 and MW-13 also contain elevated contaminant levels. However, given the previous presence of free product and very high BTEX concentrations in the vicinity of MW-12, the results appear quite favorable.

Future Actions:

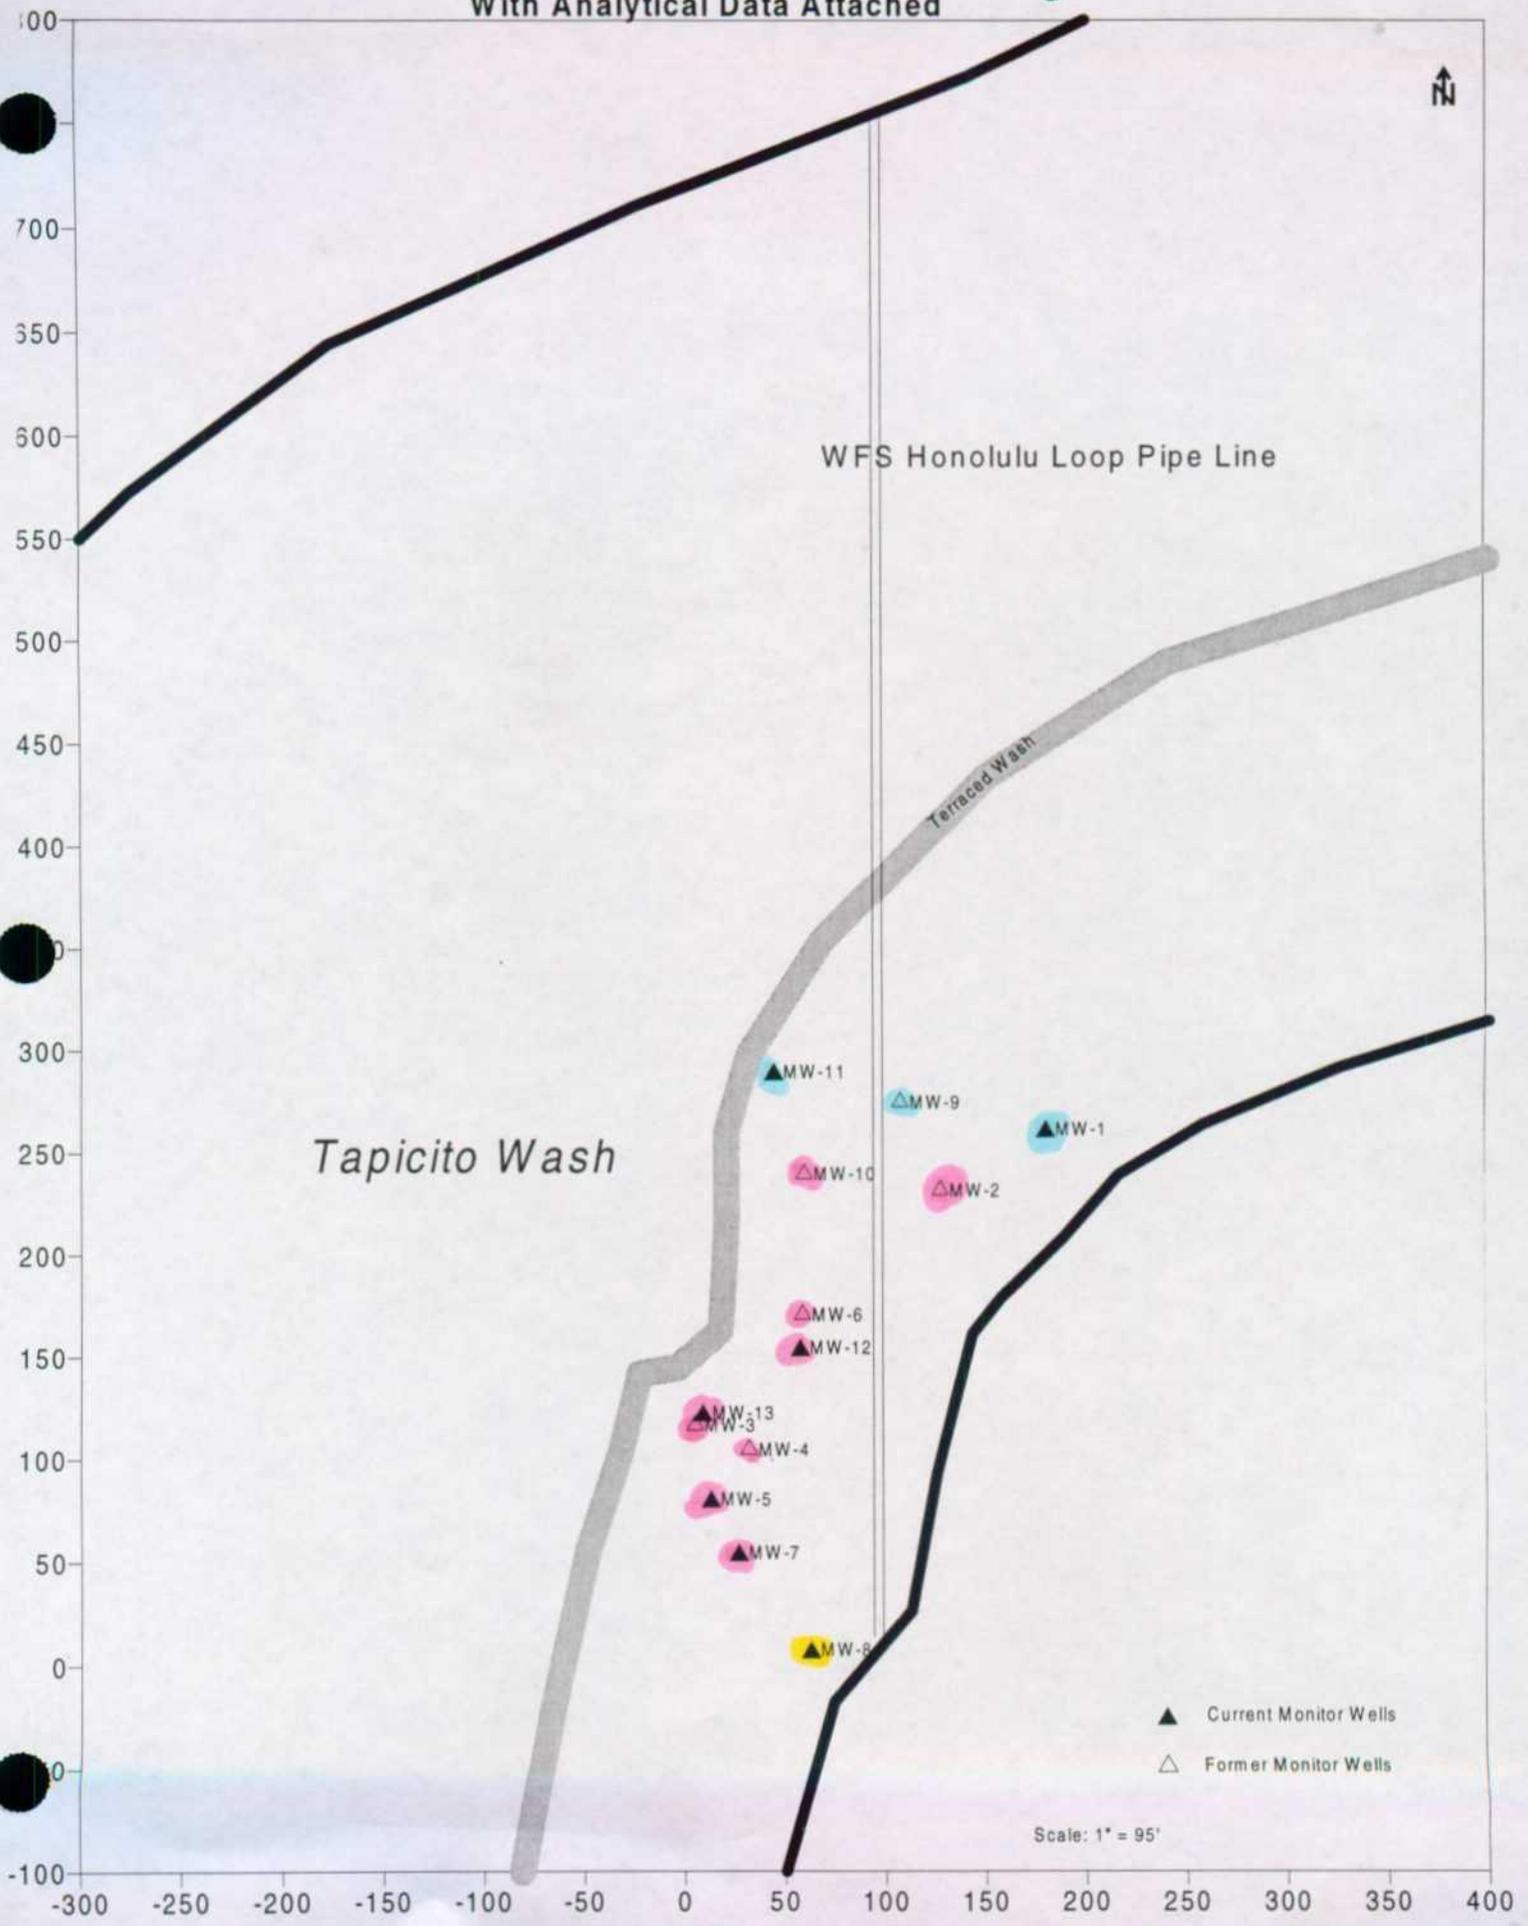

PNM will continue to monitor the Honolulu Loop Line Drip to determine if the remediation at the site was effective and whether or not natural attenuation is presently occurring.
