RE: 1999 SAN JUAN BASIN ANNUAL GROUNDWATER REPORT

Dear Bill:

PNM is pleased to submit the 1999 Annual Groundwater Report on Unlined Surface Impoundments in the San Juan Basin. Pursuant to PNM's Groundwater Management Program for Unlined Surface Impoundment Closures, the report details the ongoing investigation/remedial activities at unlined surface impoundments having groundwater contamination as identified by PNM. A list of groundwater sites reported in this document is provided below.

| Blanco Wash Drip | Mangum 1E |
| Davis 1 | McClanahan 22 |
| Dogie East Pit | McClanahan A 2E |

Consistent with PNM's San Juan Basin Groundwater Management Plan, PNM will request closure of four of the above sites, the Florance 32A, Jacques 2A, Mangum 1E and the McClanahan A2E, with the submittal of the 1st Quarter 1999 Pit Closures Report. This request is based upon the analytical data collected over the last two years at each of the sites. BTEX concentrations have been consistently below WQCC standards for four consecutive quarters.

Upon approval of the groundwater closure report, PNM will plug and abandon all of the groundwater monitoring wells at each of the locations. The concrete pad and metal vault surrounding each well will be removed. The well casing will be cut to ground surface and each well will be plugged to the surface

Site Hydrology:

The Randleman 1 site lies on alluvial terrace deposits of Kiffen Canyon, a perennial stream draining an area of moderate size. The site is about 100 feet west of the wash, and perhaps 20 feet higher. The site is located where Kiffen Canyon flows into the Animas River, but the site lies 30 or more feet above the broad alluvium plain that forms the mile-wide Animas River valley floor, and is therefore influenced more by the hydrologic setting of the local terrace deposits.

Monitor wells installed at the site revealed predominantly coarse sands in the subsurface, with occasional gravel and clay materials. Depth to water varies from 13 to 15 feet. One test hole (boring 4b on Figure 1), located next to Kiffen Canyon, penetrated hard sandstone bedrock at 15.5 feet, but typically sands were found to about 25 feet deep.

Groundwater flows southeast, towards the perennial stream in Kiffen Canyon and away from bedrock outcrops west of the site. The groundwater contour maps (Figures 2a and 2b) show groundwater gradients as low as 0.4 ft. over 90 ft. (0.004) to as high as 1.05 ft. over 60 ft.(0.018). Seasonal variations in flow direction may occur, but are expected to be minor; in previous Groundwater Reports to OCD, flow direction had a stronger eastern component, but was predominantly southeast. (It was not possible to construct water level maps for September and December, 1998 because the wells were not accessible, having been buried by operator landfarming activities.)

Water level fluctuations were observed to be less than 1 foot (Figure 3). Levels were lowest in the winter of 1997-1998, and were highest in the summer of 1998. Currently water levels appear to be declining.

Activities for Previous Year:

Figure 1 presents a site map showing BTEX for each monitoring well since groundwater contamination was discovered. On June 11, September 25 and December 14, 1998 and again on February 22, 1999, PNM performed quarterly sampling of groundwater monitoring wells at the site. PNM did not perform sampling during the second quarter of 1998 due to secondary source removal activities as discussed below. Landfarming debris covered wells MW-1 and MW-3 in September and December, so these wells were not sampled or water levels taken. Where possible, PNM measured water levels and conducted groundwater sampling for chemical analyses of benzene, toluene, ethylbenzene, and xylenes (BTEX). All sampling was performed in strict compliance with EPA protocol, and in all instances, PNM delivered the samples to OnSite Technologies, Farmington, New Mexico. The samples were analyzed for BTEX using EPA Method 8020.

PNMGS Well Site: Randleman 1 (continued)

In May, 1998, PNM conducted additional removal of contaminated soil at the Randleman. During remediation, PNM notified Burlington Resources of contamination in the area of their existing operations. Burlington commenced remediation in the area under and downgradient of their operations.

Results:

Since monitoring began almost two years ago, MW-1 has shown BTEX concentrations below WQCC standards (see Figure 1). BTEX concentrations in MW-2, the source well, have decreased over time and have now been below WQCC standards for four consecutive quarters. After the secondary source removal activities conducted by Burlington, the BTEX concentrations in well MW-3 fell below standards and have remained so for two quarters.

On February 22, 1999, PNM sampled MW-1 and MW-2 for water quality parameters to verify the previous water quality data from sampling events of June 25, 1997 and September 25, 1998. The comparative results are provided in table 1 and 2 below.

Water quality data from event to event in MW-1 and in MW-2 are consistent indicating that the data collected to date is representative of site conditions. Sulfates and TDS in both MW-1 and MW-2 are elevated (aesthetic standard: 600 mg/L sulfate; 1000 mg/L TDS). Chloride concentrations in MW-2 are also high (aesthetic standard:

250 mg/L). Since the standards are non-health based and not enforceable, no further sampling will be performed for these constituents.

Further Action:

Recent source control activity by the operator has apparently been successful in reducing BTEX concentrations in well MW-3, which could be a common downgradient well to both operator and PNM. Therefore, PNM plans to continue groundwater monitoring for two consecutive quarters, and if MW-3 remains below standards, then PNM will file for closure of the Randleman 1 site.
