

8. ANCILLARY FACILITIES

A. None required.

9. WELLSITE LAYOUT

A. Exhibit C shows the relative location and dimensions of the well pad, reserve pits, and major rig components.

B. The ground surface at this site is relatively flat with occasional sand dunes. Pad area is level and will be covered with compact caliche.

C. The reserve pits will be plastic lined.

D. A 400 x 400' work area has been staked and flagged.

10. PLANS FOR RESTORATION OF THE SURFACE.

A. After finishing drilling and/or completion operations, all equipment and other material not needed for further operations will be removed. The location will be cleaned of all trash and junk.

B. Unguarded pits, if any, containing fluids will be fenced until they have been filled.

C. This location is on Federal land and any special rehabilitations and/or revegetated requirements of the Surface Management Agency will be complied with and as expeditiously as possible. All pits will be filled and level within ninety days after abandonment.

11. OTHER INFORMATION.

A. Topography: Land surface is undulating to gently rolling and dunny. From an elevation of 3723.7' at the wellsite, the land surface slopes gently towards the southwest at approximately 30' per mile.

B. The topsoil at the wellsite is moderately hard sand.

C. The vegetation cover at the wellsite is of moderate amount, and consists primarily of prairie grass, mesquite, and miscellaneous weeds and prairie flowers. No wildlife was observed, but it is likely that typical semi-arid desert wildlife, such as rabbits, coyotes, gophers, rodents and snakes inhabit the area. The area is used for cattle grazing.

D. No lakes or ponds are near the drill site.
