NORTHWEST NEW MEXICO FACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

DEPUTY OIL & GAS INSPECTOR, DIST. 49

Title

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut-in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1. Procedure for Flow Ten No. 2 is to be the same as for Flow Ten No. 1 except

- that the previously produced some shall remain shut-in while the some which was previously shut-in is produced.
- 7. Pressures for gas-sone tests must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fateen-minute intervals during the first because thereof, and at housely intervals thereafter, including one pressure measurement immediately prior to the corclusion of each flow period. 7-day tests: immediately prior to thee beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have prewiously shown questionable test data.

24-hour oil zone teru: all pressures, throughout the entire test, abadi be continuously measured and recorded with recording pressure gauges the neuracry of which must be checked at least rwice, once at the beginning and once at the end of each test, with a deadweight pressure gauge, if a well is a gas-oil or an oil-guidual coeraptetion, the recording gauge shall be required on the oil zone only, with desdweight pressures as required above being taken on the gas sone.

8. The results of the above-described tests shall be filed in implicate within 19 days after completion of the test. Tests shall be filed with the Atter District Office of the New Mexico Oil Conservation Division on Northwest. New Mexico Parket Leakage. Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
