Florance 124-MV/DK

API # 30-045-24126-00

Location: Unit C - Sec 27 - T29N - R09W

San Juan County, New Mexico

Reason/Background for Job

The proposed work is to pull the current completion, downhole commingle the Mesaverde and Dakota formations, and produce the well up a single tubing string via plunger lift at an optimized tubing depth.

The Florance 124-MV/DK is currently configured with a dual completion originally installed in 1980. The long string is landed in the top of the Dakota interval and the short string is landed 10ft above the top of the Cliff House, leading to ineffective deliquification of most of the Mesaverde gross interval and unoptimized operation of the plunger on the long string due to the packer.

Basic job procedure

1. Pull tubing (short string and long string)
2. Fish 7" packer @ 4,550'
3. Cleanout to PBTD (6600')
4. Land tubing @ +/- 6475'
5. Return well to production
