Describe Proposed or Completed Operations**

Since the cement on the production casing didn't tie-into the intermediate casing string permission was given by the BLM and OCD on 6/30/10 to perf and stimulated the MV & DK zones before remediating the cement in an attempt to tie back into the 7" shoe @ 4305'. After the zones were completed, we shot squeeze holes at 4820' and worked to establish circulation, but the pressure was rising and were unable to establish circulation, therefore, no cement was pumped. Currently there is cement isolation between 1400' - 2800'. The BLM (Troy Salyers) and OCD (Kelly Roberts) were called and both gave verbal approval to spot cement across the squeeze holes @ 4820' and D/O and PT. If the PT is good then we will be allowed to keep the wellbore it is current state since there is adequate isolation between the producing intervals and the water zones on this well. The CBL is attached.
