DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

It is intended to drill a well thru the Pictured Cliff formation using rotary tools and to perforate and water fracture possible producing zones. Est. T.D. 3400.

Casing Program:

3 5/8" at 120' with 100 sacks regular cement circulated to surface.
2 7/8" at 3400 with 75 sacks regular cement, 75 sacks Pozzix.

The SW 1/4 of Section 20 is dedicated to this well.
SW 1/4 Jicarilla Apache Co.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.

Abstract. The purpose of this study was to determine whether there were differences in the prevalence of periodontitis between patients with type 2 diabetes mellitus (DM) and non-diabetic controls. A total of 60 patients with DM and 60 age- and sex-matched non-diabetic controls were recruited from a tertiary care hospital. All participants underwent a clinical examination of their periodontium by a single examiner who was blinded to the medical history of the subjects. The mean age of the diabetic group was 67 years (range 58–79), and the mean age of the control group was 66 years (range 58–79). The prevalence of periodontitis was significantly higher in the diabetic group than in the control group ($P < .001$). The mean percentage of sites affected by periodontitis was 22% in the diabetic group and 12% in the control group. The mean percentage of sites with severe periodontitis was 10% in the diabetic group and 3% in the control group. The results of this study suggest that patients with DM have a higher prevalence of periodontitis compared to non-diabetic controls.
