DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

We propose to drill with rotary tools, cement 8 5/8 inch surface casing at 100 feet, drill to a depth of approximately 3700 feet and run electrical surveys. We propose to cement 5½ inch production string through the Pictured Cliffs or Chacra sandstone, if gas production is indicated in either sand, perforate, and riverfrac. We propose to dually complete from these two zones if both show possible commercial production. We will submit a plan to the New Mexico Oil Conservation Commission for approval if dual completion possibilities are indicated.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
