They argue that self-esteem is a multidimensional construct that can be measured at different levels of abstraction and specificity. For example, they suggest that self-esteem can be measured at the global level (e.g., overall self-esteem) or at the specific level (e.g., self-esteem in a particular domain). They also suggest that self-esteem can be measured at the trait level (e.g., stable self-esteem) or at the state level (e.g., situational self-esteem). They argue that using a single, standardized measure of self-esteem is insufficient to capture the complexity of self-esteem because it fails to account for these different dimensions of self-esteem. They argue that using multiple measures of self-esteem, each targeting a different dimension of self-esteem, is a more comprehensive and accurate way to measure self-esteem. They argue that this approach allows researchers to capture the complexity of self-esteem and to explore the relationships between different dimensions of self-esteem and other variables. They argue that this approach is more theoretically informed and more methodologically rigorous than using a single, standardized measure of self-esteem. They argue that this approach is more likely to yield meaningful and replicable findings in the study of self-esteem.

Journal of Management Studies, 36(7), 809–826.

1. The first group of people who are not in the majority are the people who are not in the majority.

Transporter

1. The following information was obtained from the records of the Department of the Interior, Bureau of Land Management, regarding the land owned by the United States in the State of California:
