DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mud jobs, cementing points, and all other important proposed work)

This well is still water and the casing pressure has dropped to less than 200. We fill that the well is loaded up and that we possibly have a channel in our cement job. We plan a test shot at 3705' before the well was treated with sand and we had a circulation of a mud job.

We now plan to set a 4" dgs plug at 3700' and test our cement job above the producing formation from 379'-3825' by snubbing and a mud job. If we do have a bad cement job we will cement off by the squeezing. We feel that the water will be coming from the coal horizon, at 3705'-70'.

When we get a definite cement job, we will drill the plug and attempt to extract the water from the producing zone.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
