NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within severe days after actual completion of the well, and annually increasiver as prescribed by the order authorizing the multiple completion. Some nests shall also be commenced on all multiple completions within seven days following recompletion and or chemical or fracture meatment, and whenever remedial work has been done on a well during which the packer or the tabing have been disturbed. Tests small also be taken at any time that communication is suspected or when requested by the Doloston.
- 2. At least 72 hours prior to the commondement of any packer leakage test, the operator shall motify the Division in writing of the exact time the test, is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when noth assess of the dual completion are shart in for pressure staff untation. Both robbes shall entain shart in any the well-head pressure in each has staff, and provided however, that they need not remain shart in more than seven days.
- ** For how Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shushin. Such test shall be continued for sovere days in the case of a gas well and to 24 yours in the case of an oil well. Note, if on an intuit pucker, leakage test a gas well is being thosed to the atmosphere due to sack of a pipeline connection the flow period shall be three basis.
- $\epsilon=$ Following completion of flow Test No $^{\prime\prime}$ the well shall again be shallow in accordance with Paragram 3 above
- 5. Flow Lest No. 2 stander conducted over thosp the lest was indicated during Flow lest No. 1, Procedure for Flow Lest No. 2 is to a cline same as to Flow Test No. 1 except

- that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows. 3 hours tests immediately prior to the beginning of each flow period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter including one pressure measurement immediately prior to the conclusion of each flow period. 7-day tests immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- may be requested on wells which have previously shown questionable test data 24-hour oil zone tests all pressures, throughout the entire test shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be enceked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gassoil or an orlegas dual completion, the recording gauge shall oe required on the oil zone only, with deadweight pressures as required above being tasen on the gas zone.
- S. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztee District Office of the New Mexico Oil Conservation Dissistanton Northwest New Mexico Packer Leakage Test Form Revised 16-61-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (glas zones only) and gravity and GOR (oil zones only).
