NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage ten shall be commenced on each multiply completed well within seven dave after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven dave following recompletion and/or chemical or fracture treasument, and whenever temedial work has been done on a well duting which the packer or the rubing have been directed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.

LAPSED TIME

SINCE **

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The parker leakage test shall commence when both zones of the dual completion are shut in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For the Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut in. Such test shall be continued for seven dast in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial garber leakage test, a gas well in being flowed to the autoophese due to the lack of a pipeline connection the flow period shall be three bours.
- 3. Inflowing complesion of flow Test No. 1, the well shall again be shut-in, in secondance with Paragraph 3 above.
- 6 Dow Tent'No. 2 shall be conducted even though on leak was indicated during Dow Tow Ma. 5. Procedure for Dow Tent No. 2 is to be the same as for Dow Tent No. 1 every

- that the previously produced zone shall ternain thut in while the zone which was previously shut in it produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour theteof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-das tests: immediately prior to the period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be required on wells which have previously shown questionable test data.
- 24 hour oil some tent: all pressures, throughout the entire tent, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be therked at least rwice, over at the beginning and once at the end of each tent, with a deadweight pressure gauge. If a well it a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas sone.
- 8. The results of the above described tests shall be filed in triplicate within 13 days after completion of the ten. Tests shall be filed with the Aster District Office of the New Meson Oil Conservation Division on Northwest New Meson Packet Leskage Test From Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas sones only) and gravity and GOR (oil sones only).
