DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudding jobs, cementing points, and all other important proposed work)

This well was perforated in the lower Lakota formation from 6230' to 6701' and fractured with water and sand. A bridge plug was set at 6600' to perforate and fracture the upper Lakota. The 4 1/2" casing parted at 5172' while testing the bridge plug. Efforts to repair the casing have ended in milling outside the casing to 5210'. Further attempts to repair the string have been abandoned. It is intended to plug and abandon this well in the following manner:

1. Spot 50 sack cement plug at 5210'.
2. Bolt steel plate to brackenssed with a 4" x 4" pipe as a permanent marker.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
