NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At least 72 limits prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both zones of the dual completion are shut in for pressure stabilization. Both zones shall remain shut-in until the well-head pressure to each has rabilized, provided however, that they need not remain shut-in more than seven dust.
- 4. For Flow Test No. 1, one zone of the dual completion thall be produced at the normal rate of production while the other sone remains thursin. Such test shall be continued for seven dast in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial puber leakage test, a gas well is being flowed to the aumosphere due to the lack of a pipeline connection the flow period shall be there bours.
- 3. Tollowing completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Duagraph 3 above.
- 6. Fire Ten No. 2 shall be conducted even though no leak was indicated during flow Ten No. 1. Precedute for Fere Ten No. 2 is to be the same as for Flow Ten No. 1 except

- that the previously produced zone shall ternain shut in while the zone which was previously shut in produced.
- 7. Pressures for gas-zone term must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals dicreafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.

24-hout oil zone terus; all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at lean twice, once as the beginning and once as the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described term shall be filed in triplicate within 13 days after completion of the term, Term shall be filed with the Aster Direct Office of the New Mexico Oil Contervation Division on Northwest New Mexico Packer Leakage Test From Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
