NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A est shall be commenced on each multiply completed well within seven days after ne well, and arraully thereafter as prescribed by the order authorizing the multiple comple: sus shall also be connected on all multiple completions within seven days following геопиріс. chemical or fracture treatment, and whenever remedial work has been done on a well during which . er or the tubing have been disturbed. Tests shall also be taken at any time that ted or when requested by the Division.
- 2. At least 72 hours to the commencement of any packer leakage test, the operator shall notify Division in writing of continuous tests is to be commenced. Offset operators shall also be so coment of any packer leakage test, the operator shall notify the
- 3. The packer leakage test and commence when both zones of the dual completion are shat in for reasure stabilization, both zones small remain abut-in until the well-head pressure in each has stabilized, rovided however, that they need not remain shut-in more than seven days.
- . For flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shat-in. Such test shall be continued for seven days if the case of as well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be hours.
 - ollowing completion of flow Test No. 1, the well shall again be shut-in, in accordance with graph 3 above
- 6. Flow Test No. 1 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

- except that the previously produced zone shall remain shat-in while the zone which was previously shut-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure mes immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired which have previously shown questionable test data. ed, or may be requested on wells
- 24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with
- deadweight pressures as required above being taken on the gaz zone.

 The results of the above described tests shall be filed in triplicate within 15 days a ... completion of the test. Tests shall be filed with the Aztec District Office No Mexico Packer Leakage Northwest New Mexico Packer Leakage Test form acvised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
