NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A passet classific test shall be commenced on each multiply completed well within seven days after actual completion of the well and annually thereafter as prescribed by the addendather zing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion; and or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the trooms have been distance. Tests shall also be taken at any time that communication is suspected or when expected by the Division.
- 2. At least 72 nears prior to the commencement of any packer leakage test, the operator shall nearly the Dryssen in wining of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The sacker leakage test shall commence when both zones of the dual completion are sharen for pressure standization. Both zones shall remain sharen until the well-head resistion in cach has stab, ized, provided however, that they need not remain sharen more than several days.
- 4. For Flow Fest No. 1, one zone of the dual completion shall be produced at the normal rate of production which the interizene remains shurin. Such rest shall be continued for seven daws of the case of a gas well and for 24 hours in the case of an oil well. Note lift on an initial backer leakage test a gas well is being flowed to the atmosphere due to lack of a opposite connection the flow period shall be three hours.
- $5-1\,{\rm oh}/m$ by compacting of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1 except

- that the previously produced zone shall remain shall-in while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows. 3 focus tests immediately prior to the beginning of each flow period, at fifteen-mutule intervals during the first hour thereof, and at hour kintervals as thereafter, including one pressure measurement minerdiately prior to the conclusion of each flow period. 7-day tests, immediately prior to the beginning of each flow period, at least one time during each flow period fait approximately the midway point; at dimmediately prior to the cenclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test during
- 24-nour oil zone tests, all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-all or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required at the being tusen on the gas zone.
- 8. The results of the above-described tests shall be filed in triplicate within 35 days are completion of the test. Tests shall be filed with the Azzer District Office of the New Movico Oil Conservation Division on Northwest New Movico Packer Leakage. Test Form Resister 13-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
