Basin Dakota Gas San Juan New Mexico
 (Field) (County or Subdivision) (State or Territory)

The elevation of the derrick floor above sea level is ? ft. Will advise elevation as soon as received from Surveyor.

DETAILS OF WORK

(State names of and expected depths to objective sands; show sizes, weights, and lengths of proposed casings; indicate mudlogging jobs, cementing points, and all other important proposed work)

It is proposed to drill this well with rotary tools to a depth sufficient to test the Dakota formation. Estimated total depth 6350'. Anticipated formations to be encountered are Graneros Sand at approximately 6090' and the Dakota sand at approximately 6170'.

8 5/8" OD Surface casing will be set at approximately 200' and cemented from bottom to top with approximately 200 sacks cement. If productive zones are encountered 4 1/2" OD or 5 1/2" OD oil string will be run and cemented with sufficient cement to protect all zones. Possible productive zones will be perforated, tested, treated if necessary, and well completed.

I understand that this plan of work must receive approval in writing by the Geological Survey before operations may be commenced.
