Figure 6 shows the results of the regression analysis. The dependent variable is the number of days off work due to sickness absence. The independent variables are age, gender, education, income, health status, and job characteristics. The model explains 18% of the variance in the dependent variable. The results show that older workers have fewer days off work due to sickness absence than younger workers. Female workers have more days off work due to sickness absence than male workers. Workers with higher education have fewer days off work due to sickness absence than workers with lower education. Workers with higher income have fewer days off work due to sickness absence than workers with lower income. Workers with better health status have fewer days off work due to sickness absence than workers with worse health status. Job characteristics such as job demands, control, and social support also influence the number of days off work due to sickness absence.
