NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packet leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture measurement, and whenever remedial work has been done on a well during which the packet or the rubing have been distrubed. Term shall also be taken at any time that communication is asspected or when requested by the Division.

renced at thour, date) # #

THE

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall could the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3. The packer leakage test shall commence when both sones of the dual completion are shut in for pressure trabilization. Both sones shall remain shut-in usual the well-head pressure in each has nabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Fow Text No. 1, one lone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such text shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 3. Following completion of Flow Ten No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Test No. 1 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 1 a to be the super as for Flow Test No. 1 except

- that the previously produced 2000 shall remain shur-in while the 2000 which was previously shur-in is produced.
- 7. Pressure for gui-tone term must be measured on each tone with a deadweight pressure gauge at time intervals a follows: 3 hours term: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first bour theteof, and at bourly intervals thereafter, including one pressure measurement immediately prior to the technism of each flow period. 7-day term: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the morbisism of each flow period. Other pressure may be caken as derived, or may be requested on wells which have previously shown questionable test data.

14-hour oil sone term: all premura, throughout the entire terr, shall be continuously measured and recorded with recording premure gauges the accuracy of which must be checked at least roice, once at the beginning and once at the end of each terr, with a deadweight premure gauge. If a well is a gas oil or an oil-gas dual completion, the recording gauge shall be required on the oil sone only, with deadweight premure as required above being taken on the gas sone.

8. The results of the above-described term shall be filed in triplicate within 13 days after completion of the tert. Term shall be filed with the Arter District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Lexiage Test Form Revised 10-01-78 with all dead-weight pressures indicated thereon as well as the flowing a temperatures (gas rooms only) and gravity and GOR (oil some only).
