## NORTHWEST NEWMEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within seven days after actual completion of the well, and armually increaster as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and or chiemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- 2. At last "2 hours prior to the commencement of any packer basage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- 3 The packer leakage test shall commence when both zones of the dual completion are shut-in fit pressure stabilization. Both zones shall remain situation that the will-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such test shall be continued for seven does in the case of a gas well and for 24 hours in the case of an oil well. Note if, on an initial packer leakage test, a gas well is being flowed to the atm sphere due to lack of a pipeline connection the flow period shall be three boars.
- 5 Following completion of Flow Test No. 1, the well snat, again be sout-in, in accordance with Paragraph 3 above
- 6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow. Test No. 1. Procedure for Flow Test No. 2 is to be the same as it if Flow Test No. 1 except

- that the previously produced zone shall replace sharp while the zone which was previously shut-in is produced
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows 3 focus tests unmediately prior to the beginning of each flow period, at tifteen-minute into has due ing the first hour the coil, and at hourly intervals thereafter, including one pressure in east-rement immediately prior to the conclusion of each flow period. 7-day tests, immediately prior to the opinion of each flow period at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be tasen as desired or may be requested on wells which have prior to sky shown questionable test data.

24-hour oil zone tests, all pressures introughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at teast wide, once at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gastod or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with deadweight pressures as required above being taken on the gas zone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed within the Azieo District Office of the New Mexico Off Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures are cated therein as well as the flowing temperatures (gas zones only) and granity and GOR (oil zones only).
