Isolate and squeeze cement any leaks. If leaks are squeezed near the base of the 0jo Alamo formation, no additional block squeeze of the 7" annulus is planned. If there are no leaks near the base of the 0jo Alamo formation, perforate 2 squeeze holes at the base of the 0jo Alamo formation and block squeeze the 7" annulus with approximately 125 sacks of cement. Clean out if hole conditions permit, otherwise sidetrack and redrill to approximately 6200'. Run a full string of 4 1/2" production casing and sufficient amount of cement to tie into the 7" casing shoe. Selectively perforate and sand-water fracture the Mesa Verde formation. 18.
