### NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- 1. A packer imbage use shall be commenced on each multiply completed well within seven days after actual corapletion of the well, and assumily thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture assument, and whenever remedial work has been done on a well during which the practive or the tubing have been disturbed. Torus shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the enumenement of any packer leakage sun, the operator shall entify the Division in writing of the exact time the test is to be enumeneed. Offset operators shall also be so notified.
- 3 The packer lenkage sem shall consucere when both somes of the dual completion are shurt-in for pressure stabilization. Both somes shall remain shurt-in until the well-head pressure as such has stabilized, provided however, that they need not remain shurt-in some than seven door.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rose of production while the other zone remains abut-in. Such sex shall be menimed for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the structuphere due to the lack of a pipelane connection the flow period shall be three hours.
- 5. Pollowing complexion of Flow Test No. 3, the well shall again be short-in, in seem dance with Paragraph 3 above.
- 6. Place Tear'No. 2 shall be conducted even though so lesk was indicated during Flow Tean No. 1. Precedure for Flow Tean No. 2 is to be the same as for Flow Tean No. 1 course

- that the previously produced same shall sessain shor-in while the same which was previously shor-in is produced.
- 7. Premove for gas-some some most be measured on each some with a deadweight premove gauge at since insurvals as follows: 3 hours some insurvals prior to the beginning of such flow-period, at fifteen-massone insurvals during the first hour thereof, and at hourly inservals thereofore, including one pressure measurement itemseligatly prior to the exchanion of such flow period. 7-day same immediately prior to the beginning of such flow period, at least one time during each flow period (as approximately the midway pount) and immediately prior to the conclusion of such flow period. Other pressure may be taken as desired, or may be requested on with which have previously above quorinatable sage date.

34-hour oil some unus: all pressurus, throughout the entire test, thall be estatiously measured and seconded with recording pressure gauges the accounty of which must be checked at least rovice, must or the beginning and once or the end of each turn, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as sequired above being taken on the gas same.

8. The results of the above-described rests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aster Dutziet Office of the New Messon Oil Conservation Division on Northwest New Messon Packet Leskage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas assess only) and growny and GOR (oil assess only).
