## NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each multiply completed well within seven days after across completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracrure treasment, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Tests shall also be taken at any time that communication is suspected of when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shart-in for prevoure stabilization. Both zones shall remain shart-in until the well-head pressure in each has stabilized, provided however, that they need not remain short-in more than green days.
- 4. For Flow Text No. 1, one some of the dual completion shall be produced at the normal rate of production while the other some remains short-in. Such text shall be convinued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Puragraph 3 shows.
- Flow Test'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as fat Flow Test No. 1 except

- that the previously produced some shall remain show-in while the some which was previously shor-in is produced.
- 7. Pressures for gas-some tests great be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement instinctionly prior to the conclusion of each flow period. 7-day tests: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, at may be requested on wells which have previously shown questionable test data.

14-hour oil some text: all pressures, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least roise, must us the beginning and once at the end of each stat, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gus dual completion, the recording gauge shall be required on the oil some only, with deadweight pressures as required above being taken on the gas some.

8. The results of the above-described tests shall be filed in triplicate within 19 days after completion of the test. Tests shall be filed with the Astec Dutrics Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leskage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas some only) and gravity and GOR (oil somes only).
