NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage sem shall be commenced on each multiply completed well within seven days after acrual completion of the well, and anoually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture treatment, and whenever remedial work has been done on a well during which the packer or the raibing have been distrated. Term shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior so the commencement of any packer leakage rest, the operator shall notify the Division in writing of the exact time the test is to be enumenced. Offset operators shall also be so notified.
- The packer leakage sex shall commence when both zones of the dual completion are shart in for preware stabilization. Both zones shall remain shart in until the well-head pressure in each has stabilized, provided however, that they need not remain short in more than even dors.
- 4. For Flow Tex No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains short-in. Such text shall be continued for zeven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well in being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be short-in, in accordance with Paragraph 3 shows.
- 6. How Ten'No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1. Procedure for Flow Ten No. 2 is so be the same as for Flow Ten No. 1 except

that the previously produced zone shall remain shut-in while the zone which was previously shut-in is produced.

7. Pressures for gas-some tests must be measured on each some with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fafteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day sexts: immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, of may be requested on wells which have previously shown questionable test data.

24-hour oil sone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accusacy of which must be checked at least twice, must at the beginning and once at the end of each test, with a deadweight pressure gauge. If a well is a gas-oil or an oil-gus dual completion, the recording gauge shall be required on the oil sone only, with deadweight pressures as required above being taken on the gas sone.

8. The results of the above-described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Asset Dutter Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing testsperatures (gas 2000s only) and gravity and GOR (oil 2000s only).
