NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

... A packer insings test shall be commenced on each multiply completed well within seven days after ... except that the previous ty produced zone shall remain siza-in while the zone which actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be connected on all multiple completions within seven days following recompletion and/or chemical or frac-tare treatment, and whenever remodual worg has been done on a well during which the pacing or the tabing have been disturbed. Tests smill also be taken at any time that communication is suspected or when requested by the Division.

2. At least 72 hours prior to the commencements of any packer leakage test, the operator shall notify the Division m writing of the exact time the test is to be commenced. Offset operators shall also be so posified.

3. The nacker issings test shall commonce when both zones of the dual completion are shas-in for pressure stabilization. both zones shall remain shat-in until the well-head pressure m each has stabilized, provided however, that they need not remain shut-in more than seven days.

4. For now Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-m. Such test shall be continued for seven days if the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an mitial nacarr leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall - deadweight pressures as required above being taken on the piz zone. he three nours.

5. Following completion of flow Test No. 1, the well shall again be shas-in. in accommon with Paragraph 3 above

6. Flow Test No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is to be the same as for Flow Test No. 1

was previously stat-m is produced.

7. Pressures for gas-zone tests must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours tests: immediately prior to the beginning of each flow-period, at fifteen minute intervals during the first hour thereof, and at hourty intervals thereafter, including one pressure measurement immediately prior to the flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionship test data.

24-hour oil zone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be obscized at least twice, once at the beginning and once at the end of each test, with a demoweight pressure gauge. If a well is a gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil zone only, with

8. The results of the anove described tests shall be filed in triplicate within 15 days after completion of the test. Tests shall be filed with the Aztec District Office of the New Mexico Oil Conservation Division of Northwest New Mexico Paciner Loainge Test form Revised 10/01/78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas zones only) and gravity and GOR (oil zones only).
