NORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

- A packer leakage test shall be commenced on each soultiply completed well within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such tests shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture measureme, and whenever remedial work has been done on a well during which the packer or the rubing have been disrusted. Tests shall also be taken at any time that communication is suspected or when requested by the Division.
- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the sest is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shart-in for previous stabilization. Both zones shall remain shart-in until the well-head pressure in each has stabilized, provided however, that they need not remain abut-in more than areen days.
- 4. For Flow Test No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shar-in. Such test shall be continued for seven days in the case of a quewell and for 24 hours in the case of an oil well. Mose: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shor-in, in accordance with Paragraph 3 obove.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Text No. 1. Procedure for Flow Text No. 2 is so be the same as for Flow Text No. 1 except

- that the previously produced some shall remain shus-in while the some which was previous ly shur-in is produced.
- 7. Pressures for gus-some term must be measured on each some with a deadweipressure gauge at time intervals as follows: 3 hours term; immediately prior to the beging of each flow-period, at fifteen-minute intervals during the first hour thereof, anhourly intervals thereafter, including one pressure measurement immediately prior to conclusion of each flow period. 7-day term: immediately prior to the beginning of flow period, at least one time during each flow period (at approximately the midpoint) and immediately prior to the conclusion of each flow period. Other pressures be taken as desired, or may be requested on wells which have previously shown qtionable test data.

24-hour oil zone text: all pressures, throughout the entire text, shall be continued and recorded with recording pressure gauges the accuracy of which must checked at least rovice, once at the beginning and once at the end of each text, widesdweight pressure gauge. If a well is a gas-oil or up oil-gas dual completion, the recing gauge shall be required on the oil zone only; with deadweight pressures as recy above being taken on the gas zone.

8. The results of the above-described seres shall be filed in niplicate within 15 days completion of the test. Tests shall be filed with the Assec Duties Office of the New M Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Re 10-01-78 with all deadweight pressures indicated thereon as well as the fit temperatures (gas 20003 only) and gravity and GOR (oil 20003 only).
