

Robert C. Anderson
Bite Map. Site No. 4
NW 1/4 Sec. 14 - Twp. 31N-R16W
San Juan Co., New Mexico

13-POINT SURFACE USE PLAN

1. The proposed location is approximately 15 miles in a northeasterly direction from the km north exit from U.S. Hwy. 550 near Waterflow, N. M. A paved road runs north at this exit for approximately two or three miles to a point immediately south of the San Juan Power plant. At this point, turn east on an existing dirt road and follow in a northwesterly direction finally to a point on this road which is located approximately one quarter mile southeast of a windmill designated Windmill No. 111 as shown on U.S.G.S. Heifer Point - N. Mex.-Colo. topographic map. Here, turn south on access road and follow approximately one half mile to the well location.
 2. The access road to the location will be approx. one half mile long, running south from the existing road. The tank battery, if required, will be constructed on the location near the well site.
 3. The proposed location is 1350' SW1 and 1450' SW1 of Section 14, Township 31 North, Range 16 West in San Juan County, New Mexico. This is to be a proposed 2300' Dakota sand well, and all drilled formations will be tested as would any prudent operator. (See attached topo. map).
 4. No lateral roads to other locations are planned.
 5. If well is a producer, tank battery will be constructed on existing well pad.
 6. Fresh water will be trucked from the San Juan river approximately 15 miles to the south.
 7. Waste disposal will be in the reserve pit and trash pit. A pit for cuttings while air drilling will be 15 to 20 feet southeast of the well site.
- 8.29. No camps or airstrips will be constructed.
10. A rig layout plat is attached.
 11. The surface will be restored as near possible to the original condition, including grading the location and pits as soon as practical. Grass will be reseeded on the disturbed area of the location.
 12. The terrain in the area is that of mostly irregular sandstone outcrops and low hills, with juniper and very little native grass. A moderate amount of grading will be required for the well site and will not affect the natural drainage of the area.
