NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leskage was shall be commenced on each analuply complexed well within seven dars after screak completion of the well, and anoually thereafter as prescribed by the order authorizing the mairiple completion. Such seas shall also be commenced on all multiple completions within seven days following recomplexion and/or chemical or fracrure resonent, and whenever remedial work has been done on a well during which the packet or the rabing have been disturbed. Term shall also be taken at any time that comminution is suspected or when requested by the Division.

2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the text is to be commenced. Office operators shall also be so perified.

3. The packer leakage test shall commence when both zones of the dual completion are share-in for prevente subdiction. Both tones shall remain shut-in uncil the well-bend pressure in each has stabilized, provided however, that they need not remain shot-in more then seven doet.

4. For New Text No. 1, one zone of the dual completion shall be produced at the normal rate of production while the other zone remains shut-in. Such seat shall be continued for seven days in the case of a gas well and for 24 hours in the case of an ail well. None: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours,

5. Following completion of Flow Test No. 1, the well shall again be shot-in, in accordance with Purspraph 3 chave.

6. Flow Tex'No. 2 shall be conducted even though no leak was indicated during flow Test No. 1. Procedure for Flow Test No. 2 is so be the sorte as far Flow Test No. 1 emerged that the previously produced some shall remain abus-in while the some which was previously shet-in is produced.

7. Pressures for gas-none texts must be measured on each some with a deadweight pressure gauge at time incervals as follows: 3 hours sens: immediately prior to the beginning of each flow-period at fateen-minute intervals during the first hour thereof, and at bourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day sesses immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and intracdiscely prior to the exactuaion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable per dara.

34-hour oil some te set: all premiers, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the scenacy of which sourt be checked at least evice, more at the beginning and more at the end of each test, with desdweight pressure gauge. If a well is a gas-ail or an ail-gus dual completion, the record ing gauge shall be required on the oil some only, with deadweight pressures as require shove being taken on the gas some.

8. The results of the abave-described zeros shall be filed in applicate within 15 days after completion of the text. Texts shall be filed with the Aster Dutins Office of the New Mean Oil Conservation Division on Northwest New Mexico Packet Leskage Tex Form Levier 10-01-78 with all diadweight pressures indicated thereon as well as the flower temperatures (gas soons only) and gravity and GOR (oil soons only).
