HORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

 A packer leakage vest shall be commenced on each multiply complexed well within seven days after acrual complexion of the well, and annually thereafter as prescribed by the order authorizing the multiple complexion. Such term shall also be commenced on all raultuple complexions within seven days following recomplexions and/or chemical or fracture resources, and whenever remedial work has been done on a well during which the packer or the rubing have been directed. Term shall also be taken at any time that communication at suspected or when requested by the Division.

LAPSED TIME

BNCE **

THE

rer, de lai

- At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so notified.
- The packer leakage test shall commence when both zones of the dual completion are shart-in for previous stabilization. Both zones shall remain shut-in until the well-head pressure in each has stabilized, previded however, that they need not remain abut-in more than seven doys.
- 4. For Flow Text No. 1, one rone of the dual completion shall be produced at the normal rate of production while the other zone remains sharein. Such next shall be continued for seven days in the case of a gas well and for 14 hours in the case of an oil well. Note: if, on an initial packer leakage text, a gas well is being flowed to the acmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shot-in, in accordance with Paragraph 3 shore.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Procedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

that the previously produced 2000 shall remain abus-in while the 2000 which was previously abut-in is produced.

7. Pressures for gas-zone texts must be measured on each zone with a deadweight pressure gauge at time intervals as follows: 3 hours sens: immediately prior to the begunning of each flow-period, at fifteen-minute intervals during the first hour thereof, and a hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period, 7-day ossue immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures make taken as desired, or may be requested on wells which have previously shown questionable test data.

16-hour oil some text: all pressures, throughout the entire text, shall be continuously measured and recorded with recording pressure gauges the securacy of which stant to checked at lean roise, once at the leginoing and once at the end of each text, with deadweight pressure gauge. If a well is a gra-oil or an oil-gus dual completion, the recording gauge shall be required on the oil some only; with deadweight pressures as require above being taken on the gas some.

8. The results of the above-described sens shall be filed in triplicate within 15 days aft corruptetion of the test. Tests shall be filed with the Assec Dutties Office of the New Mean Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Revies 10-01-78 with all deadweight pressures indicated thereon as well as the flows semperatures (gas 2002s only) and gravity and GOR (oil 2002s only).
