HORTHWEST NEW MEDICO PACKER LEAKAGE TEST INSTRUCTIONS

1. A packer leakage was shall be commenced on each southing completed well within seven days after across completion of the well, and annually thereafter as prescribed by the order authorizing the multiple complexion. Such tests shall also be commenced on all roultiple completions within seven days following recompletion and/or chemical or fracture resument, and whenever remedial work has been done on a well during which the packet or the tubing have been disturbed. Term shall also be taken at any time that communication is supercred or when requested by the Division.

Tide

- 2. At least 72 hours prior to the commencement of any packer leakage test, the operator shall notify the Division in writing of the exact time the test is to be commenced. Offset operators shall also be so metaliced.
- 3. The packer leakage sext shall commence when both zones of the dual completion are shut-in for previous stabilization. Both zones shall remain shut-in until the well-head resoure in each has mabilised, provided however, that they need not remain shot-in more then erren ders.
- 4. For Plew Tex No. 1, one zone of the dual completion shall be produced at the normal race of production while the other some remains show-its. Such nest shall be continued for seven does in the case of a gas well and for 14 hours in the case of an oil well. None: if, on an initial packer leakage seat, a gas well is being flowed to the assumphere due to the lack of a pipeline rennertion the flow period shall be three hours.
-). Following completion of New Yest No. 1, the well shall again be short-in, in accordance with Puragraph 3 above.
- 6. Flow Text'No. 2 shall be conducted even though no leak was indicated during Flow Test No. 1. Precedure for Flow Test No. 2 is so be the same as for Flow Test No. 1 except

- that the previously produced some shall remain short in while the some which was previous ly shut-in is produced.
- 7. Pressures for gas-zone tests must be measured on each zone with a deadweight premure gauge as time intervals as follows: 3 hours sexu: immediately prior to the beginning of each flow-period, at fateen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day wast: issuediscely prior to the beginning of each flow period, at least one time during each flow period (at approximantly the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which here previously shown questionable test data.

24-hour oil some next: all pressures, throughout the entire test, shall be entitiously measured and recorded with recording pressure gauges the accuracy of which must be checked at least roice, once at the beginning and once at the end of each test, with a desducight pressure gauge. If a well is a gra-oil or on oil-gas deal completion, the recording gauge shall be required on the oil soon only, with desducight pressures as required above being taken on the gas some.

8. The results of the above-described upos shall be filed in triplicate within 19 days after completion of the text. Texts shall be filed with the Amer Durant Office of the New Mexic Oil Conservation Division on Northwest New Mexico Packet Leakage Test Form Revise 10-01-78 with all desidweight pressures indicated thereon as well as the flowin semperatures (gas seems early) and grevity and GOR (eil seems early).
