13-PROPOSED WELL SITE PLAN

1. The proposed location is approximately 10 miles in a north-westerly direction from the north exit from U.S. Hwy. 66 near Cameron, N.M. - paved road runs north at this exit for approximately two or three miles to a point immediately south of the San Juan power plant. At this point, turn west on an existing dirt road and follow in a north-westerly direction for a distance of approximately eight to nine miles or to a point which is approx. one mile southeast of a windmill designated Windmill No. 1 - as shown on U.S.G.S. Weiler point - N.Mex.-Colo. topographic map. Here, turn northeast on access road and follow approximately 200 feet to the location.
2. The access road to the location will be approx. 200 feet long, running northeast from the existing road. The tank battery, if required, will be constructed at the location on the well site.
3. The proposed location is 790' SW1 and 200' SW2 of Section 13, Township 31 North, Range 10 East in San Juan County, New Mexico. This is to be a proposed 2350' Dakota sand well, and all drilled formations will be tested as would any prudent operator. (See attached topo. map).
4. No lateral roads to other locations are planned.
5. If well is a producer, tank battery will be constructed on existing well pad.
6. Fresh water will be trucked from the San Juan River approximately 10 miles to the south.
7. Waste disposal will be in the reserve pit and trash pit. A pit for cuttings while air drilling will be 15 to 20 feet southeast of the well site.
8. No camps or airstrip will be constructed.
9. A rig layout plat is attached.
10. The surface will be restored as near possible to the original condition, including grading the location and pits as soon as practical. Grass will be reseeded on the disturbed area of the location.
11. The terrain in the area is rather flat with very little native grass. Very little grading will be required for the well site and will not effect the natural drainage of the area.
