NORTHWEST NEW MEXICO PACKER LEAKAGE TEST INSTRUCTIONS

E. A packer leakage test shall be commenced on each multiply completed with within seven days after actual completion of the well, and annually thereafter as prescribed by the order authorizing the multiple completion. Such term shall also be commenced on all multiple completions within seven days following recompletion and/or chemical or fracture measurement, and whenever remedial work has been done on a well during which the packer or the rubing have been distruibled. Term shall also be taken at any time that communication is suspected or when requested by the Division.

Commerced at fleur, date) # #

- At least 72 hours prior to the commencement of any picker leakage text, the operator shall notify the Division in writing of the exact time the text is to be commenced. Offset operators shall also be so notified.
- 3. The packet lexisge test shall commence when both zones of the dual completion are shuttin for pressure stabilization. Both zones shall termain shuttin usual the well-head pressure in each has stabilized, provided however, that they need not remain shut-in more than seven days.
- 4. For Flow Test No. 1, one lone of the dust completion shall be produced at the normal rate of production while the other sone remains shut in. Such test shall be continued for seven days in the case of a gas well and for 24 hours in the case of an oil well. Note: if, on an initial packer leakage test, a gas well is being flowed to the atmosphere due to the lack of a pipeline connection the flow period shall be three hours.
- 5. Following completion of Flow Test No. 1, the well shall again be shut-in, in accordance with Paragraph 3 above.
- 6. Flow Ten'No. 2 shall be conducted even though no leak was indicated during Flow Ten No. 1. Procedure for Flow Ten No. 2 is to be the same as for Flow Ten No. 1 except

- that the previously produced 2000 shall temain shut in while the 2000 which was previously shut in it produced.
- 7. Pressures for gas-zone term must be measured on each zone with a dead-weight pressure gauge at time intervals as follows: 3 hours term immediately prior to the beginning of each flow-period, at fifteen-minute intervals during the first hour thereof, and at hourly intervals thereafter, including one pressure measurement immediately prior to the conclusion of each flow period. 7-day term immediately prior to the beginning of each flow period, at least one time during each flow period (at approximately the midway point) and immediately prior to the conclusion of each flow period. Other pressures may be taken as desired, or may be requested on wells which have previously shown questionable test data.
- 24-hour oil tone tests: all pressures, throughout the entire test, shall be continuously measured and recorded with recording pressure gauges the accuracy of which must be checked at least twice, once at the beginning and once at the end of each test, with a decidenging pressure gauge. If a well is gas-oil or an oil-gas dual completion, the recording gauge shall be required on the oil took only, with deadweight pressures as required above being taken on the gas zone.
- 8. The results of the above described tests shall be filed in triplicate within 15 days after completion of the test. Tists shall be filed with the Aster District Office of the New Mexico Oil Conservation Division on Northwest New Mexico Packer Leakage Test Form Revised 10-01-78 with all deadweight pressures indicated thereon as well as the flowing temperatures (gas 2000s only) and gravity and GOR [oil 2000s only).
